MULTIPLIERS OF LAPLACE TRANSFORM TYPE FOR
LAGUERRE AND HERMITE EXPANSIONS

PABLO L. DE NÁPOLI, IRENE DRELICHMAN, AND RICARDO G. DURÁN

Abstract. We present a new criterion for the boundedness in weighted $L^p$ spaces of multiplier operators for Laguerre and Hermite expansions that arise from a Laplace-Stieltjes transform. As a special case, we recover known results on weighted estimates for Laguerre and Hermite fractional integrals with a unified and simpler approach.

1. Introduction

The aim of this paper is to obtain weighted estimates for multipliers of Laplace transform type for Laguerre and Hermite orthogonal expansions. To explain our results, recall first that the Laguerre functions, for a given $\alpha > -1$, are given by

$$l^\alpha_k(x) = \left( \frac{k!}{\Gamma(k + \alpha + 1)} \right)^{1/2} e^{-x/2} L^\alpha_k(x), \quad k \in \mathbb{N}_0$$

where $L^\alpha_k(x)$ are the Laguerre polynomials. The $l^\alpha_k(x)$ are eigenfunctions with eigenvalues $\lambda_{\alpha,k} = k + (\alpha + 1)/2$ of the differential operator

$$L = -\left( x \frac{d^2}{dx^2} + (\alpha + 1) \frac{d}{dx} - \frac{x}{4} \right)$$

and are an orthonormal basis in $L^2(\mathbb{R}_+, x^\alpha dx)$. Therefore, for $\gamma < p(\alpha + 1) - 1$ we can associate to any $f \in L^p(\mathbb{R}_+, x^\gamma dx)$ its Laguerre series:

$$f(x) \sim \sum_{k=0}^\infty a_{\alpha,k}(f) l^\alpha_k(x), \quad a_{\alpha,k}(f) = \int_0^\infty f(x) l^\alpha_k(x) x^\alpha dx$$

and, given a sequence $\{m_k\}$, we can define a multiplier operator by

$$M_{\alpha,m}f(x) \sim \sum_{k=0}^\infty a_{\alpha,k}(f) m_k l^\alpha_k(x).$$

The main example of the kind of multipliers we are interested in is the Laguerre fractional integral, introduced by G. Gasper, K. Stempak and W. Trebels in [6] as an analogue in the Laguerre setting of the classical fractional integral of Fourier analysis, and given by

$$I_\sigma f(x) \sim \sum_{k=0}^\infty (k + 1)^{-\sigma} a_{k,\alpha} l^\alpha_k(x).$$

In [6] the authors obtained weighted estimates for this operator that were later improved by G. Gasper and W. Trebels in [7] using a completely different proof. In this work we recover some of the ideas of the original method of [6], but simplifying the proof in many technical details and extending it to obtain a better range of exponents that, in particular, give the same result of [7] for the Laguerre fractional integral. Moreover, we show that our proof applies to a wide class of multipliers, namely multipliers arising from a Laplace-Stieltjes transform, which are of the form (1.3) with \( m_k = m(k) \) given by the Laplace-Stieltjes transform of some function \( \psi(t) \), that is,

\[
m(s) = \mathcal{L}\psi(s) := \int_0^\infty e^{-st}\psi(t) dt.
\]

We will assume that \( \psi \) is of bounded variation in \( \mathbb{R}_+ \), so that the Laplace transform converges absolutely in the half plane \( \text{Re}(s) \geq 0 \) (see [18, Chapter 2]) and the definition of the operator \( M_{\alpha,m} \) makes sense.

Multipliers of this kind are quite natural to consider and, indeed, a slightly different definition is given by E. M. Stein in [13] and was previously used in the unweighted setting by E. Sasso in [12], while T. Martinez has considered multipliers of Laplace transform type for ultraspherical expansions in [9].

Other kind of multipliers for Laguerre expansions have also been considered, see, for instance, [6, 15, 16] where boundedness criteria are given in terms of difference operators. In our case, we will only require minimal assumptions on the function \( \psi \), which are more natural in our context, and easier to verify in the case of the Laguerre fractional integral and in other examples that we will consider later. Indeed, the main theorem we will prove for multipliers for Laguerre expansions reads as follows:

**Theorem 1.1.** Assume that \( \alpha > -1 \) and that \( M_{\alpha,m} \) is a multiplier of Laplace transform type for Laguerre expansions, given by (1.3) and (1.5), such that:

1. \( \int_0^\infty |d\psi(t)| dt < +\infty; \)
2. there exist \( \delta > 0, 0 < \sigma < \alpha + 1 \), and \( C > 0 \) such that \( |\psi(t)| \leq Ct^\sigma \) for \( 0 \leq t \leq \delta \).

Then \( M_{\alpha,m} \) can be extended to a bounded operator such that

\[
\|M_{\alpha,m}f\|_{L^q(\mathbb{R}_+,x^{(\alpha-bq)})} \leq C\|f\|_{L^p(\mathbb{R}_+,x^{(\alpha-ap)})}
\]

provided that the following conditions hold:

1. \( 1 < p \leq q < \infty \)
2. \( a < \frac{\alpha + 1}{p'} \)
3. \( b < \frac{\alpha + 1}{q} \)
4. \( 2a + 2b \geq \left( \frac{1}{q} - \frac{1}{p} \right)(2\alpha + 1) \)
and

\begin{equation}
\frac{1}{q} \geq \frac{1}{p} - \frac{\sigma - a - b}{\alpha + 1}.
\end{equation}

The well-known connection between Laguerre and Hermite expansions will then allow us to extend the above result to an analogous result for Laplace type multipliers for Hermite expansions. To make this precise, recall that, given \( f \in L^2(\mathbb{R}) \), we can consider its Hermite series expansion

\begin{equation}
f \sim \sum_{k=0}^{\infty} c_k(f) h_k, \quad c_k(f) = \int_{-\infty}^{\infty} f(x) h_k(x) dx.
\end{equation}

where \( h_k \) are the Hermite functions given by

\[ h_k(x) = \frac{(-1)^k}{(2k! \pi^{1/2})^{1/2}} H_k(x) e^{-\frac{x^2}{2}}, \]

which are the normalized eigenfunctions of the Harmonic oscillator operator \( \mathcal{H} = -\frac{d^2}{dx^2} + |x|^2 \).

As before, given a bounded sequence \( \{m_k\} \) we can define a multiplier operator by

\begin{equation}
M_{H,m} f \sim \sum_{k=0}^{\infty} c_k(f) m_k h_k
\end{equation}

and we say that it is a Laplace transform type multiplier if equation (1.15) holds. Then, we have the following analogue of Theorem 1.1:

**Theorem 1.2.** Assume that \( M_{H,m} \) is a multiplier of Laplace transform type for Hermite expansions, given by (1.12) and (1.5), such that:

(H1h) \[ \int_0^{\infty} |d\psi| (t) < +\infty; \]

(H2h) there exist \( \delta > 0, 0 < \sigma < \frac{1}{2} \), and \( C > 0 \) such that \[ |\psi(t)| \leq Ct^\sigma \quad \text{for } 0 \leq t \leq \delta. \]

Then \( M_{H,m} \) can be extended to a bounded operator such that

\[ ||M_{H,m} f||_{L^q(\mathbb{R}, x^{-bq})} \leq C ||f||_{L^p(\mathbb{R}, x^{aq})} \]

provided that the following conditions hold:

\begin{align}
1 < p & \leq q < \infty \\
\frac{1}{q} & \geq \frac{1}{p} - (2s - a - b).
\end{align}
The remainder of this paper is organized as follows. In Section 2 we prove Theorem 1.1. For the case $\alpha > -\frac{1}{2}$ the proof relies on the representation of the operator as a twisted generalized convolution, already used in [6] for the Laguerre fractional integral. However, instead of using the method of that paper to obtain weighted bounds, we give a simpler proof based on the use of Young’s inequality in the multiplicative group $(\mathbb{R}_+, \cdot)$, which allows us to obtain a wider range of exponents. Moreover, we obtain an estimate for the convolution kernel which simplifies and generalizes Lemma 2.1 from [6]. For the case $-1 < \alpha \leq -\frac{1}{2}$ the result is obtained from the previous case by means of a weighted transplantation theorem from [5]. In Section 3 we exploit the relation between Laguerre and Hermite expansions to derive Theorem 1.2 from Theorem 1.1. Finally, in Section 4 we present some examples of operators covered by the two main theorems and make some further comments.

2. Proof of the theorem in the Laguerre case

In this section we prove Theorem 1.1. We will divide the proof in three steps:

1. We write the operator as a twisted generalized convolution and obtain the estimate for the convolution kernel when $\alpha > -\frac{1}{2}$. This part of the proof follows essentially the ideas of [6], but in the more general setting of multipliers of Laplace transform type. In particular, we provide an easier proof of the analogue of [6, Lemma 2.1] in this setting (see Lemma 2.1 below).

2. We complete the proof of the theorem in the case $\alpha > -\frac{1}{2}$ by proving weighted estimates for the generalized euclidean convolution.

3. We extend the results to the case $-1 < \alpha \leq -\frac{1}{2}$ using the case $\alpha > -\frac{1}{2}$ and a weighted transplantation theorem from [5] (Lemma 2.4 below).

2.1. Step 1: representing the multiplier operator as a twisted generalized convolution when $\alpha > -\frac{1}{2}$.

Following [10, 1] we define the twisted generalized convolution of $F$ and $G$ by

$$F \times G := \int_0^\infty \tau_x F(y) G(y) y^{2\alpha+1} \, dy$$

where the twisted translation operator is defined by

$$\tau_x F(y) = \frac{\Gamma(\alpha + 1)}{\pi^{1/2} \Gamma(\alpha + 1/2)} \int_0^\pi F((x, y)\theta) J_{\alpha-1/2}(xy \sin \theta)(\sin \theta)^{2\alpha} \, d\theta$$

with

$$J_{\beta}(x) = \Gamma(\beta + 1)J_{\beta}(x)/(x/2)^{\beta}$$

where $J_{\beta}(x)$ is the Bessel function of order $\beta$ and

$$(x, y)\theta = (x^2 + y^2 - 2xy \cos \theta)^{1/2}.$$ 

Then, we have (formally) that

$$M_{\alpha,m} f(x^2) = F \times G$$

where

$$F(y) = f(y^2) \quad , \quad G(y) = g(y^2)$$

and

$$g(x) \sim \frac{1}{\Gamma(\alpha + 1)} \sum_{k=0}^\infty m_k L_k^\alpha(x) e^{-\frac{x}{2}}.$$
Recalling that \(|J_\beta(x)| \leq 1\) if \(\beta \geq 0\), we have that:

\begin{equation}
|F \times G| \leq |F| \star |G|
\end{equation}

where \(\star\) denotes the generalized Euclidean convolution which is defined by

\begin{equation}
F \star G(x) := \int_0^\infty \tau_x^E F(y) G(y) y^{2\alpha+1} dy
\end{equation}

with

\begin{equation}
\tau_x^E F(y) := \frac{\Gamma(\alpha + 1)}{\pi^{1/2} \Gamma(\alpha + 1/2)} \int_0^\pi F((x,y)\theta) (\sin \theta)^{2\alpha} d\theta.
\end{equation}

As a consequence of (2.1) and (2.3), the operator \(M_{\alpha,m}\) is pointwise bounded by a generalized euclidean convolution with the kernel \(G\) (with respect to the measure \(x^{2\alpha+1} dx\)). Therefore, we need to obtain an appropriate estimate for \(G(x) = g(x^2)\), that essentially is:

\[ |g(x)| \leq Cx^{\sigma - \alpha - 1} \text{ for } \alpha \geq 0 \text{ and } 0 < \sigma < \alpha + 1 \]

(see Lemma 2.1 below for a precise statement).

This generalizes the result given in [6, Lemma 2.1] but, while in that paper the proof of the corresponding estimate is based on delicate pointwise estimates for the Laguerre functions, our proof is based on the following generating function for the Laguerre polynomials (see, for instance, [16]):

\begin{equation}
\sum_{k=0}^\infty L_\alpha^k(x)w^k = (1 - w)^{-\alpha - 1} e^{-x/t} := Z_{\alpha,x}(w) \quad (|w| < 1)
\end{equation}

To explain our ideas, we point out that if the series in (2.2) were convergent (this need not be the case) we would have:

\[
g(x) = \frac{1}{\Gamma(\alpha + 1)} \sum_{k=0}^\infty m_k L_\alpha^k(x) e^{-\frac{x}{t}}
\]

\[
= \frac{1}{\Gamma(\alpha + 1)} \sum_{k=0}^\infty \left( \int_0^\infty e^{-kt} d\psi(t) \right) L_\alpha^k(x) e^{-\frac{x}{t}}
\]

\[
= \frac{1}{\Gamma(\alpha + 1)} e^{-\frac{x}{t}} \int_0^\infty Z_{\alpha,x}(e^{-1}) d\psi(t).
\]

The main advantage of this formula is that it shields a rather explicit expression for \(g\) in which, thanks to (2.6), the Laguerre polynomials do not appear.

However, in general it is not clear if the series in (2.2) is convergent (not even in the special case of the Laguerre fractional integral \(m(t) = t^{\sigma - 1}\)). Moreover, the integration of the series in \(Z_{\alpha,x}(w)\) is difficult to justify since it is not uniformly convergent in the interval \([0, 1]\) (because \(Z_{\alpha,x}(w)\) is not analytical for \(w = 1\)).

Nevertheless, we will see that the formal manipulations above can be given a rigorous meaning if we agree in understanding the convergence of the series in (2.2) in the Abel sense. For this purpose, we introduce a regularization parameter \(\rho \in (0, 1)\) and consider the regularized function

\begin{equation}
g_\rho(x) = \frac{1}{\Gamma(\alpha + 1)} \sum_{k=0}^\infty m_k \rho^k L_\alpha^k(x) e^{-\frac{x}{t}}
\end{equation}
and recall that the series in (2.2) is sumable in Abel sense to the limit \( g(x) \) if there exists the limit

\[
g(x) = \lim_{\rho \to 1} g_\rho(x).
\]

With this definition in mind, we can give a rigorous meaning to the heuristic idea described above. More precisely, we will prove the following:

**Lemma 2.1.** Let \( g_\rho \) be defined by (2.7). Then:

1. For \( 0 < \rho < 1 \) the series (2.7) converges absolutely.
2. The following representation formula holds:

\[
g_\rho(x) = \frac{1}{\Gamma(\alpha + 1)} \int_0^\infty Z_{\alpha,x}(\rho e^{-t}) d\psi(t).
\]

3. If we define \( g(x) \) by setting \( \rho = 1 \) in this representation formula, \( g(x) \) is well defined and the series (2.2) converges to \( g(x) \) in the Abel sense.
4. If \( \alpha > 0, 0 \leq \rho \leq 1 \) and \( 0 < \sigma < \alpha + 1 \)

\[
|g_\rho(x)| \leq Cx^{\sigma - \alpha - 1},
\]

where the constant \( C = C(\alpha, \sigma) \) does not depend on \( \rho \in [0, 1] \).

**Proof.** (1) Observe first that hypothesis \((H1)\) implies that \((m_k)\) is a bounded sequence. Indeed,

\[
|m_k| \leq \int_0^\infty e^{-kt} |d\phi(t)| \leq \int_0^\infty |d\phi(t)| = C < +\infty.
\]

Now recall that \((H6)\) Lemma 1.5.3), if \( \nu = \nu(k) = 4k + 2\alpha + 2 \),

\[
|l_k^\nu(x)| \leq C(x\nu)^{-\frac{\nu}{2}} \quad \text{if} \quad \frac{1}{\nu} \leq x \leq \frac{\nu}{2}.
\]

Therefore, if we fix \( x \), for \( k \geq k_0 \), \( x \) is in the region where this estimate holds (since \( \nu \to +\infty \) when \( k \to +\infty \)), and from Stirling’s formula we deduce that

\[
\frac{k!}{\Gamma(k + \alpha + 1)} = \frac{\Gamma(k + 1)}{\Gamma(k + \alpha + 1)} = O(k^{-\alpha}).
\]

Then we have the following estimate for the terms of the series in (2.7)

\[
|m_k \rho^k L_k^\nu(x)| e^{-\frac{\nu}{2}} \leq C(x) \rho^k k^{-\sigma} \quad \text{for} \quad k \geq k_0,
\]

and, since \( \rho < 1 \), this implies that the series converges absolutely.

(2) First, observe that \( Z_{\alpha,x}(w) \) is continuous as a function of a real variable for \( w \in [0, 1] \) (if we define \( Z_{\alpha,x}(1) = 0 \)) and, therefore, it is bounded, say

\[
|Z_{\alpha,x}(w)| \leq C = C(\alpha, x) \quad \text{for} \quad w \in [0, 1].
\]
Hence, using hypothesis \((H1)\) we see that the integral in the representation formula is convergent for any \(\rho \in [0, 1]\). Moreover, from our assumptions we have that, for \(\rho < 1\),

\[
g_\rho(x) = \frac{1}{\Gamma(\alpha + 1)} \sum_{k=0}^{\infty} m_k \rho^k L^0_k(x)e^{-\frac{x^2}{2}}
\]

\[
= \frac{1}{\Gamma(\alpha + 1)} \sum_{k=0}^{\infty} \left( \int_0^\infty \rho^k e^{-k t} d\psi(t) \right) L^0_k(x)e^{-\frac{x^2}{2}}
\]

\[
= \lim_{N \to +\infty} \frac{1}{\Gamma(\alpha + 1)} \sum_{k=0}^{N} \left( \int_0^\infty \rho^k e^{-k t} d\psi(t) \right) L^0_k(x)e^{-\frac{x^2}{2}}
\]

\[
(2.10)
\]

\[
= \lim_{N \to +\infty} \frac{1}{\Gamma(\alpha + 1)} \int_0^\infty Z^{(N)}_{\alpha,x}(\rho e^{-t}) d\psi(t)
\]

where

\[
Z^{(N)}_{\alpha,x}(w) = \sum_{k=0}^{N} L^0_k(x)w^k
\]

denotes a partial sum of the series for \(Z_{\alpha,x}(w)\). Now, since \(\rho < 1\), that series converges uniformly in the interval \([0, \rho]\), so that given \(\varepsilon > 0\) there exists \(N_0 = N_0(\varepsilon)\) such that

\[
|Z_{\alpha,x}(w) - Z^{(N)}_{\alpha,x}(w)| < \varepsilon \text{ if } N \geq N_0.
\]

Using this estimate and hypothesis \((H1)\), we obtain

\[
\left| \int_0^\infty Z_{\alpha,x}(\rho e^{-t}) \, d\psi(t) - \int_0^\infty Z^{(N)}_{\alpha,x}(\rho e^{-t}) \, d\psi(t) \right|
\]

\[
\leq \int_0^\infty |Z_{\alpha,x}(\rho e^{-t}) - Z^{(N)}_{\alpha,x}(\rho e^{-t})| \, |d\psi(t)|
\]

\[
\leq C\varepsilon
\]

from which we conclude that

\[
(2.11) \quad \lim_{N \to +\infty} \int_0^\infty Z^{(N)}_{\alpha,x}(\rho e^{-t}) \, d\psi(t) = \int_0^\infty Z_{\alpha,x}(\rho e^{-t}) \, d\psi(t)
\]

and, replacing \((2.11)\) into \((2.10)\) we obtain \((2.9)\).

(3) We have already observed that the integral in \((2.9)\) is convergent for \(\rho = 1\). Moreover, the bound we have proved in \((2.8)\) for \(Z_{\alpha,x}\), and \((H1)\) imply that we can apply the Lebesgue bounded convergence theorem to this integral (with a constant majorant function, which is integrable with respect to \(|d\psi(t)|\) by \((H1)\)), to conclude that \((2.8)\) holds.
Let $\delta$ be as in (H2) and observe that
\[
\Gamma(\alpha + 1, x) = e^{-\frac{x^2}{2}} \int_0^\infty Z_{\alpha,x}(\rho e^{-t}) d\psi(t)
\]
\[
= e^{-\frac{x^2}{2}} \int_0^\delta Z_{\alpha,x}(\rho e^{-t}) d\psi(t) + e^{-\frac{x^2}{2}} \int_\delta^\infty Z_{\alpha,x}(\rho e^{-t}) d\psi(t)
\]
\[
= e^{-\frac{x^2}{2}} \int_0^\delta Z_{\alpha,x}(\rho e^{-t}) d\psi(t) + e^{-\frac{x^2}{2}} \int_0^\infty Z_{\alpha,x}(\rho e^{-t}) d\psi(t)
\]
\[
- e^{-\frac{x^2}{2}} \int_0^\delta Z_{\alpha,x}(1) d\psi(t) + e^{-\frac{x^2}{2}} Z_{\alpha,x}(\rho e^{-t}) d\psi(t)
\]
\[
\geq e^{-\frac{x^2}{2}} \int_0^\delta Z_{\alpha,x}(\rho e^{-t}) d\psi(t) + e^{-\frac{x^2}{2}} \int_\delta^\infty Z_{\alpha,x}(\rho e^{-t}) d\psi(t)
\]
\[
\geq e^{-\frac{x^2}{2}} \int_0^\delta Z_{\alpha,x}(\rho e^{-t}) d\psi(t)
\]
Since $|Z_{\alpha,x}(\rho e^{-t})| \leq (1 - \rho e^{-t})^{-\alpha - 1} \leq C_{\delta}$, $Z_{\alpha,x}(1) = 0$, and $\sigma - \alpha - 1 < 0$, clearly $(ii) - (iii) \leq C_{\delta} x^{\sigma - \alpha - 1}$.

To bound $(iv)$, notice that if $\omega = \rho e^{-t}$ and $t > \delta$, $0 \leq Z_{\alpha,x}(\omega) \leq M_{\delta}$.

Therefore, using (H1) and the fact that $\sigma - \alpha - 1 < 0$ we obtain
\[
(iv) \leq e^{-\frac{x^2}{2}} M_{\delta} \int_\delta^\infty |d\psi(t)| \leq C x^{\sigma - \alpha - 1}.
\]

Now, observing that
\[
Z'_{\alpha,x}(\omega) = - (\alpha + 1) Z_{\alpha+1,x}(\omega) - x Z_{\alpha+2,x}(\omega).
\]
and using (H2), we obtain
\[
(i) \leq e^{-\frac{x^2}{2}} \int_0^\delta Z_{\alpha+1,x}(\rho e^{-t}) \rho e^{-t} \sigma dt
\]
\[
+ e^{-\frac{x^2}{2}} \int_0^\delta x Z_{\alpha+2,x}(\rho e^{-t}) \rho e^{-t} \sigma dt
\]
and the wanted estimates in this case follow by a direct application of the following lemma.

\[\square\]

**Lemma 2.2.** In the conditions of Lemma 2.1, if
\[
I(x) = e^{-\frac{x^2}{2}} \int_0^\infty Z_{\beta,x}(\rho e^{-t}) \rho e^{-t} \sigma^{-1} dt,
\]
then, $|I(x)| \leq C x^{\sigma - \beta - 1}$.

**Proof.** Making the change of variables $\omega = \rho e^{-t}$, and recalling the definition of $Z_{\beta,x}(\omega)$ given by (2.6), we see that
\[
I(x) = e^{-\frac{x^2}{2}} \int_0^\beta (1 - w)^{-\beta - 1} e^{-\frac{x^2}{2} w} \log^{-1} \left( \frac{\rho}{\omega} \right) d\omega
\]
Making the change of variables $u = \frac{1}{2} + \frac{x}{\rho}$ this is

$$I(x) = \int_{\frac{1}{2}}^{\frac{1}{2} + \frac{x}{\rho}} \left( u + \frac{1}{2} \right)^{\beta + 1} e^{-ux} \left[ \log \left( \frac{u + \frac{1}{2}}{\rho u - \frac{1}{2}} \right) \right]^{-1} \frac{1}{(u + \frac{1}{2})^2} du$$

(2.12)

\[ \leq C \int_{\frac{1}{2}}^{\frac{1}{2} + \frac{x}{\rho}} u^{\beta - 1} e^{-ux} \left( u - \frac{1}{2} \right)^{1 - \sigma} \left[ u(\rho - 1) + \frac{1}{2}(\rho + 1) \right]^{-1} du \]

where in (2.12) we have used that, since

$$\rho u = 1 + u(\rho - 1) + \frac{1}{2}(\rho + 1),$$

then

$$\log \left( \frac{u + \frac{1}{2}}{\rho u - \frac{1}{2}} \right) \leq \frac{u(\rho - 1) + \frac{1}{2}(\rho + 1)}{u - \frac{1}{2}}.$$  

We claim that $\tilde{u}(\rho) \leq C$. Indeed, if $\sigma - 1 \leq 0$, then

$$\tilde{u}(\rho) \leq \left[ \frac{1}{2}(\rho + 1) \right]^{-1} \leq \left( \frac{1}{2} \right)^{-1},$$

and if $\sigma - 1 > 0$, since $u \leq \frac{1}{2} + \frac{x}{\rho - 1}$, then

$$\tilde{u}(\rho) \leq (2\rho)^{\sigma - 1} \leq 2^{\sigma - 1}.$$  

Therefore,

$$I(x) \leq C \int_{\frac{1}{2}}^{\infty} u^{\beta - \sigma} e^{-ux} du$$

(2.13)

\[ = C \int_{\frac{1}{2}}^{\infty} v^{\beta - \sigma} x^{\beta - \sigma + 1} e^{-v} dv \]

\[ \leq C x^{\beta + \sigma - 1} \int_{0}^{\infty} v^{\beta - \sigma} e^{-v} dv \]

(2.14)

where in (2.13) we have made the change of variables $v = ux$, and in (2.14) we have used that $\beta - \sigma > -1$.

\[ \hphantom{\text{2.2. Step 2: weighted estimates for the generalized Euclidean convolution. Following the idea of the previous section, we define a regularized multiplier operator $M_{\alpha, m, \rho}$ by:}} \]

\[ \hphantom{\text{2.2. Step 2: weighted estimates for the generalized Euclidean convolution. Following the idea of the previous section, we define a regularized multiplier operator $M_{\alpha, m, \rho}$ by:}} \]

2.2. Step 2: weighted estimates for the generalized Euclidean convolution. Following the idea of the previous section, we define a regularized multiplier operator $M_{\alpha, m, \rho}$ by:

$$M_{\alpha, m, \rho}f(x) := \sum_{k=0}^{\infty} m_k \rho_k \alpha_{k, \alpha}^\rho \xi_k^\rho(x)$$

(2.15)

In this section we will obtain the estimate

$$\left( \int_{0}^{\infty} |M_{\alpha, m, \rho}(f)|^q x^{a - bq} dx \right)^{\frac{1}{q}} \leq C \left( \int_{0}^{\infty} |f|^p x^{a + ap} dx \right)^{\frac{1}{p}}$$

for $f \in L^p(\mathbb{R}_+, x^{a + ap})$ with a constant $C$ independent of the regularization parameter $\rho$ and appropriate $a, b$ (see Theorem 2.1).
Indeed, the operator can be expressed as before as a twisted generalized convolution with kernel \( G_{\rho}(y) = g_{\rho}(y^2) \) (in place of \( G \)), and by Lemma 2.1 if \( F(y) = f(y^2) \), we have the pointwise bound
\[
|M_{\alpha,m,\rho}f(x^2)| \leq (|F| \star |G_{\rho}|)(x) \leq C(|F| \star |x^{2(\sigma-\alpha-1)}|)(x).
\]
Therefore, (2.2) will follow from a weighted inequality for the generalized Euclidean convolution with kernel \( K_{\sigma} := x^{2(\sigma-\alpha-1)} \) (Theorem 2.1).

Once we have (2.2), Theorem 1.1 will follow by a standard density argument. Indeed, if we consider the space
\[
E = \{ f(x^2) = p(x)e^{-x^2/2} : 0 \leq x, p(x) \text{ a polynomial} \},
\]
any \( f \in E \) has only a finite number of non-vanishing Laguerre coefficients. In that case, it is straightforward that \( M_{\alpha,m}f(x^2) \) is well-defined and:
\[
M_{\alpha,m}f(x^2) = \lim_{\rho \to 1} M_{\alpha,m,\rho}f(x^2)
\]
Then, by Fatou’s lemma,
\[
\int_0^\infty |M_{\alpha,m}(f)|^q x^{\alpha-bq} \, dx \leq \lim_{\rho \to 1} \int_0^\infty |M_{\alpha,m,\rho}(f)|^q x^{\alpha-bq} \, dx
\]
and, therefore, we obtain
\[
\left( \int_0^\infty |M_{\alpha,m,\rho}(f)|^q x^{\alpha-bq} \, dx \right)^{1/q} \leq C \left( \int_0^\infty |f|^p x^{\alpha+ap} \, dx \right)^{1/p} \forall f \in E
\]
Since \( E \) is dense in \( L^p(\mathbb{R}_+, x^{\alpha+ap}) \), we deduce that \( M_{\alpha,m} \) can be extended to a bounded operator from \( L^p(\mathbb{R}_+, x^{\alpha+ap}) \) to \( L^q(\mathbb{R}_+, x^{\alpha+aq}) \). Moreover, the extended operator satisfies:
\[
M_{\alpha,m}f = \lim_{\rho \to 1} M_{\alpha,m,\rho}f
\]
This means, that the formula (1.3) is valid for \( f \in L^p(\mathbb{R}_+, x^{\alpha+ap}) \) if the summation is interpreted in the Abel sense with convergence in \( L^q(\mathbb{R}_+, x^{\alpha+aq}) \).

Now we can conclude the proof of Theorem 1.1 in the case \( \alpha > -\frac{1}{2} \).

**Theorem 2.1.** Let \( \alpha > -\frac{1}{2} > 0 \) such that \( 0 < \sigma < \alpha + 1 \) and \( M_{\alpha,m,\rho} \) be given by (2.16) such that it satisfies (H1) and (H2). Then, for all \( f \in L^p(\mathbb{R}_+, x^{\alpha+ap}) \), the following estimate holds
\[
\|M_{\alpha,m,\rho}f(x^2)\|_{L^q(\mathbb{R}_+, x^{\alpha+aq})} \leq \|f(x^2)\|_{L^p(\mathbb{R}_+, x^{\alpha+ap})}
\]
provided that
\[
a < \frac{\alpha + 1}{p} \quad \text{(2.17)}
\]
\[
b < \frac{\alpha + 1}{q} \quad \text{(2.18)}
\]
\[
2a + 2b \geq \left( \frac{1}{q} - \frac{1}{p} \right) (2\alpha + 1) \quad \text{(2.19)}
\]
and
\[
\frac{1}{q} = \frac{1}{p} - \frac{\sigma - a - b}{\alpha + 1} \quad \text{(2.20)}
\]
Proof. Let \( K_\sigma(x) := x^{2(\sigma - \alpha - 1)} \), \( F(y) = f(y^2) \) and recall that
\[
|M_{\alpha,m,\rho}f(x^2)| \leq C(|F| \ast |K_\sigma|)(x)
\]
where \( \ast \) denotes the generalized euclidean convolution defined by \((2.21)\).

We begin by computing the generalized Euclidean translation of \( K_\sigma \) given by \((2.20)\). Making the change of variables
\[
t = \cos \theta \Rightarrow dt = - \sin \theta \, d\theta = - \sqrt{1 - t^2} \, d\theta
\]
we see that
\[
\tau^E_x K_\sigma(y) = C(\alpha) \int_{-1}^{1} (x^2 + y^2 - 2xyt)^{\sigma - \alpha - 1}(1 - t^2)^{\alpha - \frac{1}{2}} \, dt.
\]
Following the notation of our previous work \([4]\), if we let
\[
I_{\gamma,k}(r) := \int_{-1}^{1} \frac{(1 - t^2)^k}{(1 - 2rt + r^2)^{\gamma}} \, dt,
\]
then
\[
\tau^E_x K_\sigma(y) = C(\alpha)y^{2(\sigma - \alpha - 1)} I_{2(1+\alpha-\sigma),\alpha-\frac{1}{2}} \left( \frac{x}{y} \right)
\]
and, therefore,
\[
K_\sigma \ast F(x) = C \int_{0}^{\infty} y^{2(\sigma - \alpha - 1)} I_{2(1+\alpha-\sigma),\alpha-\frac{1}{2}} \left( \frac{x}{y} \right) F(y)^{2\alpha + 1} \, dy
\]
\[(2.21)\]
\[
= C \int_{0}^{\infty} y^{2\sigma} I_{2(1+\alpha-\sigma),\alpha-\frac{1}{2}} \left( \frac{x}{y} \right) F(y) \frac{dy}{y}
\]
Now,
\[
\|M_{\alpha,m,\rho}f(x^2)x^{-2b}\|_{L^\alpha(\mathbb{R}_+,x^{\alpha+1})} \leq C \|K_\sigma \ast F(x)x^{-2b}\|_{L^\alpha(\mathbb{R}_+,x^{\alpha+1})}
\]
\[
= C \left( \int_{0}^{\infty} |K_\sigma \ast F(x)x^{-2b}| x^{\alpha+1} \, dx \right)^{\frac{1}{\alpha}}
\]
\[
= C \left( \int_{0}^{\infty} |K_\sigma \ast F(x)x^{\frac{2\alpha+2-2b}{\alpha}}| \, dx \right)^{\frac{1}{\alpha}}
\]
but, by \((2.21)\),
\[
[K_\sigma \ast F(x)]x^{\frac{2\alpha+2-2b}{\alpha}} = C \int_{0}^{\infty} y^{2\sigma} x^{\frac{2\alpha+2-2b}{\alpha}} I_{2(1+\alpha-\sigma),\alpha-\frac{1}{2}} \left( \frac{x}{y} \right) F(y) \frac{dy}{y}
\]
\[
= C \int_{0}^{\infty} \left( \frac{y}{x} \right)^{-\frac{2\alpha+2-2b}{\alpha}} I_{2(1-\alpha-\sigma),\alpha-\frac{1}{2}} \left( \frac{x}{y} \right) F(y) y^{2\sigma} x^{\frac{2\alpha+2-2b}{\alpha}} \, dy
\]
where \( \ast \) denotes the convolution in \( \mathbb{R}_+ \) with respect to the Haar measure \( dx \).

Then, by Young’s inequality:
\[
\|M_{\alpha,m,\rho}f(x^2)x^{-2b}\|_{L^\alpha(\mathbb{R}_+,x^{\alpha+1})} \leq \|F(x)x^{\frac{2\alpha+2-2b}{\alpha}}\|_{L^\alpha(\frac{dx}{x})} \|x^{\frac{2\alpha+2-2b}{\alpha}} I_{2(1+\alpha-\sigma),\alpha-\frac{1}{2}}(x)\|_{L^\infty(\frac{dx}{x})}
\]
provided that:

\[
\frac{1}{p} + \frac{1}{s} = 1 + \frac{1}{q}
\]

Since by hypothesis (2.20),

\[
\|F(x)x^{2\sigma + \frac{2a + 2}{p} - 2b}\|_{L^p} = \left( \int_0^\infty |F(x)x^{2\sigma + \frac{2a + 2}{p} - 2b}|^p \, dx \right)^{\frac{1}{p}}
\]

\[
= \left( \int_0^\infty |F(x)x^{2\alpha + \frac{2a + 2}{p}}| \, dx \right)^{\frac{1}{p}}
\]

\[
= \|F(x)x^{2\alpha}\|_{L^p} = \|f(x^2)\|_{L^p}.
\]

to conclude the proof of the theorem it suffices to see that

\[
\|x^{\frac{2a + 2}{2} - 2b}I_{2(1+\alpha-\sigma),\alpha-\frac{1}{2}}(x)\|_{L^{r,\infty}} < +\infty.
\]

For this purpose, we shall use the following lemma, which is a generalization of our previous result \[4, \text{Lemma 4.2}\]. The first part of the proof is the same as in that lemma, but it is included here for the sake of completeness:

**Lemma 2.3.** Let

\[
I_{\gamma,k}(r) = \int_{-1}^1 \frac{(1-t^2)^k}{(1-2rt + r^2)^{\gamma+1}} \, dt
\]

Then, for \( r \sim 1 \) and \( k > -1 \), we have that

\[
|I_{\gamma,k}(r)| \leq \begin{cases} 
C_{\gamma,k} & \text{if } \gamma < 2k + 2 \\
C_{\gamma,k} \log \left| \frac{1}{1-r} \right| & \text{if } \gamma = 2k + 2 \\
C_{\gamma,k}|1-r|^{-\gamma + 2k + 2} & \text{if } \gamma > 2k + 2
\end{cases}
\]

**Proof.** Assume first that \( k \in \mathbb{N}_0 \) and \( -\frac{3}{2} + k > -1 \). Then,

\[
I_{\gamma,k}(1) \sim \int_{-1}^1 \frac{(1-t^2)^k}{(2-2t)^{\gamma+1}} \, dt \sim C \int_{-1}^1 \frac{(1-t)^k}{(1-t)^{\gamma+1}} \, dt.
\]

Therefore, \( I_{\gamma,k} \) is bounded.

If \( -\frac{3}{2} + k = -1 \), then

\[
I_{\gamma,k}(r) \sim \int_{-1}^1 (1-t^2)^k \, dt \sim C \int_{-1}^1 \frac{(1-t)^k}{(1-t)^{\gamma+1}} \, dt.
\]

Integrating by parts \( k \) times (the boundary terms vanish),

\[
I_{\gamma,k}(r) \sim \left| \int_{-1}^1 \frac{d^k}{dt^k} \left\{ (1-t^2)^k \right\} (1-2rt + r^2)^{-\gamma + 2k} \, dt \right|.
\]

But \( \frac{d^k}{dt^k} \left\{ (1-t^2)^k \right\} \) is a polynomial of degree \( k \) and therefore is bounded in \([-1,1]\) (in fact, it is up to a constant the classical Legendre polynomial). Therefore,

\[
I_{\gamma,k}(r) \sim \frac{1}{2r} \log \left( \frac{1+r}{1-r} \right)^2 \leq C \log \frac{1}{|1-r|}.
\]

Finally, if \( -\frac{3}{2} + k < -1 \), then integrating by parts as before,

\[
I_{\gamma,k}(r) \leq C_k \int_{-1}^1 (1-2rt + r^2)^{-\frac{3}{2} + k} \, dt.
\]
Thus,
\[ I_{\gamma,k}(r) \sim (1 - 2rt + r^2)^{-\frac{\gamma}{2} + k + \frac{1}{2}} \leq C_{k,\gamma} |1 - r|^{-\gamma + 2k + 2}. \]
This finishes the proof if \( k \in \mathbb{N}_0 \).
Consider now the case \( k = m + \nu \) with \( m \in \mathbb{N}_0 \) and \( 0 < \nu < 1 \). Then,
\[
I_{\gamma,k}(r) = \int_{-1}^{1} (1 - t^2)^{\nu(m+1)+(1-\nu)m} (1 - 2rt + r^2)^{-\frac{\nu}{2} - \frac{(1-\nu)\gamma}{2}} \ dt \\
\leq I_{m+1,\gamma}(r) I_{1-\nu}(r).
\]
where in the last line we have used Hölder’s inequality with exponent \( \frac{1}{\nu} \).
If \( \gamma < 2m + 2 \), by the previous calculation
\[ |I_{\gamma,k}(r)| \leq C. \]
If \( \gamma > 2(m + 1) + 2 \), then, by the previous calculation
\[ |I_{\gamma,k}(r)| \leq C |1 - r|^{\nu(-\gamma - 2(m+1)+2)} |1 - r|^{(1-\nu)(\gamma + 2m+2)} = C |1 - r|^{-\gamma + 2k + 2}. \]
For the case \( 2m + 2 < \gamma < 2m + 4 \), notice that we can always assume \( r < 1 \), since \( I_{\gamma,k}(r) = r^{-\gamma} I_{\gamma,k}(r^{-1}) \). Then, as before, we can prove that
\[ I'_{\gamma,k}(r) \leq \gamma (1 - r) I_{\gamma+2,k}(r) \]
But now we are in the case \( \gamma + 2 > 2(m + 1) + 2 \) and, thus,
\[ |I_{\gamma+2,k}(r)| \leq C |1 - r|^{-\gamma + 2k}. \]
Therefore, if \( -\gamma + 2k + 1 \neq -1 \)
\[ I_{\gamma,k}(r) = \int_{0}^{r} I'_{\gamma,k}(s) \ ds \\
\leq C \int_{0}^{r} (1 - s)^{-\gamma + 2k + 1} \ ds \\
\leq C |1 - r|^{-\gamma + 2k + 2}, \]
and if \( -\gamma + 2k + 1 = -1 \)
\[ I_{\gamma,k}(r) \leq C \int_{0}^{r} \frac{1}{1 - s} \ ds \\
= C \log \frac{1}{|1 - r|}. \]
It remains to check the case \( k \in (-1,0) \). For this purpose, write
\[
I_{\gamma,k}(r) = \int_{-1}^{0} \frac{(1 - t^2)^k}{(1 - 2rt + r^2)^{\frac{\gamma}{2}}} \ dt + \int_{0}^{1} \frac{(1 - t^2)^k}{(1 - 2rt + r^2)^{\frac{\gamma}{2}}} \ dt \\
(i) \leq \int_{-1}^{0} (1 + t)^k \ dt = C \]
Since \( \gamma > 0 \) and \( k + 1 > 0 \),
\[ (i) \leq \int_{-1}^{0} (1 + t)^k \ dt = C \]
\[
(ii) \leq \int_0^1 \frac{(1-t)^k}{(1-2rt+r^2)^{\gamma}} dt
= -\frac{1}{k+1} \int_0^1 \frac{d}{dt}[(1-t)^{k+1}] \frac{dt}{(1-2rt+r^2)^{\gamma}}
= \frac{2r}{k+1} \int_0^1 \frac{(1-t)^{k+1}}{(1-2rt+r^2)^{\gamma+1}} dt
\leq CI_{\gamma+2,k+1}(r).
\]

and, since now \(k+1 > 0\), \(I_{\gamma,k}\) can be bounded as before. This concludes the proof of the lemma. \(\square\)

Now we are ready to conclude the proof Theorem 2.1. Remember that we need to see that

\[
\|x^{2_\alpha+2-b}I_{2(1+\alpha-\sigma),\alpha-\frac{1}{2}}(x)\|_{L^\infty(\mathbb{R})} < +\infty.
\]

Using the previous lemma, it is clear that when \(x \to 1\) and \(2(\alpha + 1 - \sigma) \leq 2(\alpha - \frac{1}{2})\) the norm (2.23) is bounded.

In the case \(2(\alpha + 1 - \sigma) > 2(\alpha - \frac{1}{2})\) (that is, \(\sigma < 3\)), the integrability condition is

\[-s \left[2(\alpha + 1 - \sigma) - 2 \left(\alpha - \frac{1}{2}\right) - 2\right] \geq -1.\]

But, using (2.22) and (2.20), we see that this is equivalent to hypothesis (2.19).

When \(x = 0\), the integrability condition is

\[\frac{2\alpha + 2}{q} - 2b > 0\]

which holds because of hypothesis (2.18).

Finally, when \(x \to \infty\), since \(I_{\alpha-\frac{1}{2},2(\alpha+1-\sigma)}(x) \sim x^{-2(\alpha+1-\sigma)}\), the condition we need to fulfill is

\[\frac{2\alpha + 2}{q} - 2b - 2(\alpha + 1 - \sigma) < 0\]

which, by (2.20), is equivalent to (2.17). \(\square\)

2.3. Extension to the case \(-1 < \alpha \leq -\frac{1}{2}\) and end of proof of Theorem 1.1. First, notice that if condition \((H2)\) holds for a certain \(0 < \sigma_0 < \alpha + 1\), then it also holds for any \(0 < \sigma < \sigma_0\). Therefore, it suffices to prove Theorem 1.1 in the case \(\frac{1}{q} = \frac{1}{p} - \frac{\sigma_0-\beta}{\alpha+1}\).

When \(\alpha > -\frac{1}{2}\) this is exactly Theorem 2.1 above. To extend this result to the case \(-1 < \alpha \leq -\frac{1}{2}\) let us consider \(-1 < \alpha < \beta\), where \(\beta > -\frac{1}{2}\), and use a transplantation result form [5 Corollary 6.19 (ii)], that we recall here as a lemma for the sake of completeness:

\textbf{Lemma 2.4 ([5])}. Let \(1 < q < \infty\). Given \(\alpha, \beta > -1\), we define the transplantation operator

\[T_{\beta}f = \sum_{k=0}^{\infty} \left(\int_{0}^{\infty} f(y)l_{\beta}^{q}(y)y^{\alpha} dy\right)l_{k}^{\beta}.\]
Then, if $\sigma_0 \in \mathbb{R}$ and $\sigma_1 = \sigma_0 + (\alpha - \beta)(\frac{1}{p} - \frac{1}{2})$, $T_{\sigma_0}^{\beta} : L_{\sigma_0}^q(\mathbb{R}_+, x^\alpha dx) \to L_{\sigma_1}^q(\mathbb{R}_+, x^\beta dx)$ and $T_{\sigma_1}^{\alpha} : L_{\sigma_1}^q(\mathbb{R}_+, x^\beta dx) \to L_{\sigma_0}^q(\mathbb{R}_+, x^\alpha dx)$ are bounded operators if and only if

$$-1 + \frac{\alpha}{q} < \sigma_0 < 1 + \frac{\alpha}{q'}.$$

Using this lemma, we can write

$$\| M_{\alpha,m} f |x|^{-\tilde{b}} \|_{L^q(\mathbb{R}_+, x^\alpha dx)} = \| T_{\alpha}^{\beta}(M_{\beta,m}(T_{\beta}^a f)) |x|^{-\tilde{b}} \|_{L^q(\mathbb{R}_+, x^\alpha dx)}$$

provided that

(2.24) \[-1 < \alpha < \beta\]

(2.25) \[-\tilde{b} = -b + (\alpha - \beta)\left(\frac{1}{p} - \frac{1}{2}\right)\]

and

(2.26) \[-1 + \frac{\alpha}{q} < -b < 1 + \frac{\alpha}{q'}\]

and, using Theorem 2.1 for $M_{\beta,m}$ with $\beta > -\frac{1}{2}$,

$$\| M_{\alpha,m,\beta}(T_{\beta}^a f) |x|^{-\tilde{b}} \|_{L^q(\mathbb{R}_+, x^\beta dx)} \leq C \| T_{\alpha}^{\beta}(T_{\beta}^a f) |x|^{-\tilde{b}} \|_{L^q(\mathbb{R}_+, x^\beta dx)}$$

provided that

(2.27) \[0 < \sigma < \beta + 1\]

(2.28) \[\tilde{a} < \frac{\beta + 1}{p'}\]

(2.29) \[\tilde{b} < \frac{\beta + 1}{q}\]

(2.30) \[2(\tilde{a} + \tilde{b}) \geq \left(\frac{1}{q} - \frac{1}{p}\right)(2\beta + 1)\]

and

(2.31) \[\frac{1}{q} = \frac{1}{p} - \frac{\sigma - \tilde{a} - \tilde{b}}{\beta + 1}\]

Finally, using Lemma 2.4 again, we obtain

(2.32) \[\| M_{\alpha,m} f |x|^{-\tilde{b}} \|_{L^q(\mathbb{R}_+, x^\alpha dx)} C \| f |x|^a \|_{L^p(\mathbb{R}_+, x^\alpha dx)}\]

provided that

(2.33) \[\tilde{a} = a + (\alpha - \beta)\left(\frac{1}{p} - \frac{1}{2}\right)\]

(2.34) \[-1 + \frac{\alpha}{p} < a < 1 + \frac{\alpha}{p'}\]

Now, replacing (2.2) and (2.25) into (2.31) we obtain

(2.35) \[\frac{1}{q} = \frac{1}{p} - \frac{\sigma - a - b}{\alpha + 1}\]
and replacing (3.2) and (2.25) into (2.30), we obtain
\[ 2a + 2b \geq \left( \frac{1}{q} - \frac{1}{p} \right) (2\alpha + 1). \]
To conclude the proof of the theorem we need to see that the restrictions \( a > -\frac{1+\alpha}{p} \)
in (2.34) and \( b > -\frac{1+\alpha}{q} \) in (2.26) are redundant. Indeed, the first one follows from (2.35) and \( b < a^{\frac{1+\alpha}{q}} \), while the second one follows from (2.35) and \( a < a^{\frac{1+\alpha}{p}} \).

3. Proof of Theorem 1.2
In this section we exploit the well-known relation between Hermite and Laguerre polynomials to obtain an analogous result to that of the previous section in the Hermite case. Indeed, recalling that
\[ H_{2k}(x) = (-1)^k 2^k k! L_k^{-\frac{1}{2}}(x^2) \]
\[ H_{2k+1}(x) = (-1)^k 2^k k! x L_k^{\frac{1}{2}}(x^2) \]
it is immediate that
\[ h_{2k}(x) = l_k^{-1/2}(x^2) \]
\[ h_{2k+1}(x) = x l_k^{1/2}(x^2) \]
It is then natural to decompose \( f = f_0 + f_1 \) where
\[ f_0(x) = \frac{f(x) + f(-x)}{2}, \quad f_1(x) = \frac{f(x) - f(-x)}{2} \]
and, clearly, when \( k = 2j \), if we let \( g_0(y) = f_0(\sqrt{y}) \) we obtain:
\[ c_k(f) = \langle f_0, h_k \rangle = 2 \int_0^{\infty} f_0(x) l_j^{-\frac{1}{2}}(x^2) \, dx = a_{-\frac{1}{2}, j}(g_0) \]
while if \( k = 2j + 1 \), and we let \( g_1(y) = \frac{1}{\sqrt{y}} f_1(\sqrt{y}) \) we have:
\[ c_k(f) = \langle f_1, h_k \rangle = 2 \int_0^{\infty} f_1(x) x l_j^{\frac{1}{2}}(x^2) \, dx = a_{\frac{1}{2}, j}(g_1) \]
Then,
\[ M_{H,m} f(x) = \sum_{j=0}^{\infty} m_{2j} a_{-\frac{1}{2}, j}(g_0) l_j^{-\frac{1}{2}}(x^2) + \sum_{j=0}^{\infty} m_{2j+1} a_{\frac{1}{2}, j}(g_1) x l_j^{\frac{1}{2}}(x^2) \]
\[ = M_{-\frac{1}{2}, m_0} g_0(x^2) + x M_{\frac{1}{2}, m_1} g_1(x^2) \]
where \( (m_0)_k = m_{2k} \) and \( (m_1)_k = m_{2k+1} \).
To apply Theorem 1.1 to this decomposition, we need to check first that \( m_0 \) and \( m_1 \) are Laplace-Stiltjes functions of certain functions \( \psi_0 \) and \( \psi_1 \). Indeed, notice that \( m_{2k} = \mathcal{L} \psi_0(k) \) where
\[ \psi_0(u) = \frac{1}{2} \psi(u/2) \]
and \( m_{2k+1} = \mathcal{L} \psi_1(k) \) where
\[ \psi_1(u) = \frac{1}{2} \int_0^{u/2} e^{-r} d\psi(r). \]
It is also easy to see that \( \psi_0 \) satisfies the hypotheses of Theorem \( 1.1 \) for \( \alpha = -\frac{1}{2} \), whereas \( \psi_1 \) satisfies the hypotheses for \( \alpha = \frac{1}{2} \) (in this case condition \( H_2 \) follows after an integration by parts).

Then,

\[
\|M_{H,m}f|^{-b}|\|_{\mathcal{L}^q} = \left( \int_{\mathbb{R}} |M_{H,m}f(x)|^q |x|^{-2b} \, dx \right)^{\frac{1}{q}}
\]

\[
(3.1)
\]

Using Minkowski's inequality and making the change of variables \( y = x^2, dx = \frac{1}{2}y^{-\frac{1}{2}} \, dy \), we see that

\[
(3.2) \quad \tilde{a} < \frac{1}{2p'}
\]

\[
(3.3) \quad b < \frac{1}{q}
\]

\[
(3.4) \quad \frac{1}{q} \geq \frac{1}{p} - \frac{s - \tilde{a} - \frac{b}{2}}{\tilde{a} - \frac{b}{2}}
\]

\[
(3.5) \quad \tilde{a} + \frac{b}{2} \geq 0
\]

\[
(3.6) \quad \tilde{a} < \frac{3}{2p'}
\]

\[
(3.7) \quad \frac{1}{q} \geq \frac{1}{p} - \frac{s - \tilde{a} + \frac{1-b}{2} - \frac{1}{q}}{\frac{3}{2}}
\]

\[
(3.8) \quad \tilde{a} + \tilde{b} \geq \left( \frac{1}{q} - \frac{1}{p} \right)
\]

Therefore,

\[
\|M_{H,m}f|^{-b}\|_{\mathcal{L}^q} \leq C \left( \int |g_0(x)|^p |x|^\tilde{a}p - \frac{b}{2} \, dx \right)^{\frac{1}{p}} + C \left( \int |g_1(x)|^p |x|^\tilde{a}p + \frac{b}{2} \, dx \right)^{\frac{1}{p}}
\]

\[
= C \left( \int |f_0(\sqrt{x})|^p |x|^\tilde{a}p - \frac{b}{2} \, dx \right)^{\frac{1}{p}} + C \left( \int |f_1(\sqrt{x})|^p |x|^\tilde{a}p + \frac{b}{2} \, dx \right)^{\frac{1}{p}}
\]

\[
= C \left( \int |f_0(x)|^p |x|^{2\tilde{a}p} \, dx \right)^{\frac{1}{p}} + C \left( \int |f_1(x)|^p |x|^{2\tilde{a}p + 2} - p \, dx \right)^{\frac{1}{p}}
\]

\[
\leq C \|f(x)|^p\|_{\mathcal{L}^q}
\]
provided that
\[(3.9)\quad a = 2\tilde{a} = 2\hat{a} + \frac{2}{p} - 1.\]

Therefore, by (3.9), (3.2) and (3.6) there must hold
\[a < \frac{1}{p}\]
while, also by (3.9), (3.4) and (3.7) are equivalent to
\[\frac{1}{q} \geq \frac{1}{p} - (2s - a - b)\]
and (3.5) and (3.8) are equivalent to
\[a + b \geq 0.\]

**Remark 3.1.** It follows from the proof of Theorem 1.2 that a better result holds if the function \(f\) is odd.

4. **Examples and further remarks**

First, we should point out that it is clear that, since a Stieltjes integral of a continuous function with respect to a function of bounded variation can be thought as an integral with respect to the corresponding Lebesgue-Stieltjes measure, we could equivalently have formulated all our results in terms of integrals with respect to regular Borel measures in \(\mathbb{R}_+\). However, we have found convenient to use the framework of Stieltjes integrals since many of the classical references on Laplace transforms are written in that framework (for instance [18]), and leave the details of a possible restatement of the theorems in the case of regular Borel measure to the reader.

We also recall that the Laplace-Stieltjes transform contains as particular cases both the ordinary Laplace transform of (locally integrable) functions (when \(\psi(t)\) is absolutely continuous), and Dirichlet series (see below). In particular, if \(\psi\) is absolutely continuous and \(\phi(t) = \psi'(t)\) (defined almost everywhere), the assumptions \((H1)\) and \((H2)\) of Theorem 1.1 can be replaced by:
\[
\text{(H1ac)} \quad \int_0^\infty |\phi(x)| \, dx < +\infty \quad \text{i.e.} \quad \phi \in L^1(\mathbb{R}_+) \]
\[
\text{(H2ac)} \quad \text{there exist } \delta > 0, \quad 0 < \sigma < \alpha + 1, \quad \text{and } C > 0 \text{ such that } \left| \int_0^t \phi(x) \, dx \right| \leq Ct^\sigma \quad \text{for } 0 < t \leq \delta.\]

In particular, assumption \((H2ac)\) holds if \(\phi(t) = O(t^{\sigma-1})\) when \(t \to 0\).

As we have already explained in the introduction, one of the main examples of the kind of multipliers we are considering is the Laguerre fractional integral introduced in [6], which corresponds to the choice \(m_k = (k+1)^{-\sigma}\).

In [11] Theorem 4.2, A. Nowak and K. Stempak considered multi-dimensional Laguerre expansions and used a slightly different definition of the fractional integral operator, given by the negative powers of the differential operator
\[(4.1)\quad L = -\left( x \frac{d^2}{dx^2} + (\alpha + 1) \frac{d}{dx} - \frac{x}{4} \right).\]
As they point out, their theorem contains as a special case the result of [6] (in the one dimensional case). To see that both operators are indeed equivalent, they rely on a deep multiplier theorem [15, Theorem 1.1].

Instead, we can see that Theorem 1.1 is applicable to both definitions by choosing:

$$m_k = (k + c)^{-\sigma}, \quad \phi(t) = \frac{1}{\Gamma(\sigma)} t^{\sigma-1} e^{-ct} \quad (c > 0)$$

The case $c = 1$ corresponds to the definition in [6], whereas the choice $c = \frac{\alpha + 1}{2}$ corresponds to the definition in [11]. Therefore, Theorem 1.1 applied to this choices, coincides in the first case with the result of [7, Theorem 1] (which is an improvement of [6, Theorem 3.1]) and improves in the second case the one-dimensional result of [11, Theorem 4.2].

The same choice of $m_k$ and $\phi$ in Theorem 1.2 gives a two-weight estimate for the Hermite fractional integral, which corresponds to the one-dimensional version of [11, Theorem 2.5].

Another interesting example is the operator $(L^2 + I)^{-\frac{\alpha}{2}}$, where $L$ is given by (4.1). In this case, Theorem 1.1 with hypotheses (H1ac) and (H2ac) instead of (H1) and (H2) applies with $\alpha = \sigma$ and

$$\phi(t) = \frac{1}{C_\alpha} e^{-\frac{\alpha+1}{\alpha} s t} J_{\frac{\alpha-1}{2}}(t) t^{\frac{\alpha-1}{2}}$$

since, by [17, formula 5, p. 386],

$$\int_0^\infty e^{-st} J_{\frac{\alpha-1}{2}}(t) t^{\frac{\alpha-1}{2}} dt = C_\alpha (s^2 + 1)^{-\frac{\alpha}{2}}$$

and, when $t \to 0$, $J_{\frac{\alpha-1}{2}}(t) t^{\frac{\alpha-1}{2}} \sim t^{\alpha-1}$.

Another interesting example is obtained by choosing $\psi(t) = e^{-s_0 t} H(t - \tau)$ where $H$ is the Heaviside unit step function:

$$H(t) = \begin{cases} 1 & \text{if} \quad t \geq 0 \\ 0 & \text{if} \quad t < 0 \end{cases}$$

and we see that Theorem 1.1 is applicable to the Heat diffusion semigroup (considered for instance in [14] and [8])

$$M_\tau = e^{-\tau L}$$

associated to the operator $L$ for any $\sigma > 0$. More generally, the same conclusion holds for

$$\psi(t) = \sum_{n=1}^{\infty} a_n e^{-s_0 t} H(t - \tau_n)$$

provided that the Dirichlet series

$$F(s) = \sum_{n=1}^{\infty} a_n e^{-\tau_n s}, \quad 0 < \tau_1 < \tau_2 < \ldots$$

congeves absolutely for $s = s_0$ (which corresponds to hypothesis (H1)).

As a final comment, we remark that finding a function $\psi$ of bounded variation such that $m_k = \Delta \psi(k)$ (see [15]) is equivalent to solving the classical Hausdorff moment problem (see [18, Chapter III]).
Acknowledgements. We wish to thank Professor K. Stempak for bringing into our attention the connection between the generalized euclidean convolution and our previous results on fractional integrals of radially symmetric functions.
