CHARACTERIZATIONS OF FRACTIONAL SOBOLEV–POINCARÉ AND
(LOCALIZED) HARDY INEQUALITIES

FIROJ SK

Abstract. In this paper, we prove capacitary versions of the fractional Sobolev–Poincaré inequalities. We characterize localized variant of the boundary fractional Sobolev–Poincaré inequalities through uniform fatness condition of the domain in $\mathbb{R}^n$. Existence type results on the fractional Hardy inequality are established in the supercritical case $sp > n$ for $s \in (0, 1)$, $p > 1$. Characterization of the fractional Hardy inequality through weak supersolution of the associate problem is also addressed.

1. Introduction and main results

The central aim of this paper is to study the Sobolev–Poincaré inequality, pointwise Hardy inequality and the Hardy inequality under some assumptions on the domain in fractional setting. Precise condition on the domain will be clarified later. It is well known that the classical Sobolev–Poincaré inequality states that for a bounded domain $\Omega \subset \mathbb{R}^n$ with $C^1$ boundary and $1 \leq p < n$, there exists a constant $C = C(n, p) > 0$ such that

$$\left( \int_{\Omega} |u(x) - u_{\Omega}|^{p^*} dx \right)^{1/p^*} \leq C \left( \int_{\Omega} |\nabla u(x)|^p dx \right)^{1/p}$$

for all $u \in W^{1, p}(\Omega)$,

where $p^* = \frac{np}{n-p}$ denotes the Sobolev critical exponent and the space $W^{1, p}(\Omega)$ is the usual classical Sobolev space, see for example [14, Chapter 4] in the case of ball. A capacitary variant of the Sobolev–Poincaré inequality eq. (1.1) were considered in [20] and for weighted case, see [27]. The well known classical (boundary) Hardy inequality states that for a bounded Lipschitz domain $\Omega \subset \mathbb{R}^n$, $1 \leq p < \infty$, there exists a constant $C = (n, p) > 0$ such that for any $u \in C^\infty_c(\Omega)

$$\int_{\Omega} \frac{|u(x)|^p}{\delta(x)^p} dx \leq C \int_{\Omega} |\nabla u(x)|^p dx,$$

where $\delta(x) := \text{dist}(x, \Omega^c)$. One can obtain the classical Hardy inequality eq. (1.2) by applying appropriately the Hardy–Littlewood–Wiener maximal function theorem on a pointwise Hardy inequality, see [17, 22] where they have introduced pointwise Hardy inequality through a maximal operator. Necessary and sufficient conditions are provided for pointwise Hardy inequalities in [23] and see [25] for weighted case. In order to get a deeper insight of the best constant in the Hardy
inequality eq. (1.2) for a domain $\Omega \subseteq \mathbb{R}^n$, one can consider the following minimization problem which naturally related to Hardy’s inequality

$$\lambda_p(\Omega) = \inf_{u \in W_0^{1,p}(\Omega) \setminus \{0\}} \frac{\int_{\Omega} |\nabla u(x)|^p dx}{\int_{\Omega} \frac{|u(x)|^p}{\delta(x)^p} dx},$$

where the space $W_0^{1,p}(\Omega)$ denotes the closure of the space $C_0^\infty(\Omega)$ with respect to the Sobolev norm $(\int_{\Omega} |u|^p dx + \int_{\Omega} |\nabla u|^p dx)^{1/p}$. It is immediate to observe that the constant $\lambda_p(\Omega) > 0$ if and only if the classical Hardy inequality eq. (1.2) holds true in $\Omega$. One more important observation is that a minimizer of the problem eq. (1.3) gives the existence of a weak solution of the following nonlinear eigenvalue problem

$$\text{div} \left( |\nabla u|^{p-2} \nabla u \right) + \lambda_p(\Omega) \frac{|u|^{p-2} u}{\delta(x)^p} = 0 \text{ in } \Omega,$$

and vise versa. Interestingly, in [21], the authors addressed this issue and established characterization of Hardy’s inequality eq. (1.2) through weak supersolutions of the nonlinear eigenvalue problem eq. (1.4) for a domain $\Omega$ in $\mathbb{R}^n$. This paper aims to extend further research on this topic in fractional Sobolev spaces.

For this, let us introduce the fractional Sobolev space. Let $\Omega \subseteq \mathbb{R}^n$ be any open set, $0 < s < 1$, $1 \leq p < \infty$, we define the fractional Sobolev space

$$W^{s,p}(\Omega) := \{ u \in L^p(\Omega) : [u]_{s,p,\Omega} < \infty \},$$

endowed with the so-called fractional Sobolev norm, given by

$$|||u|||_{s,p,\Omega} := \left( ||u||^p_{L^p(\Omega)} + [u]^p_{s,p,\Omega} \right)^{1/p},$$

where

$$[u]_{s,p,\Omega} := \int_{\Omega} \int_{\Omega} \frac{|u(x) - u(y)|^p}{|x - y|^{n+sp}} dxdy,$$

is the Gagliardo seminorm. For the study of fractional Sobolev spaces in a systematic way we refer to [8, 10, 12, 16] and references therein. At this stage, we consider two more Banach spaces $W_0^{s,p}(\Omega)$ and $W^{s,p}(\mathbb{R}^n)$ defined as the closure of the space $C_0^\infty(\Omega)$ with the norms $|| \cdot ||_{s,p,\Omega}$ and $|| \cdot ||_{s,p,\mathbb{R}^n}$ respectively. These two spaces arise naturally in studying weak solutions of the Dirichlet problems involving regional fractional $p$-Laplacian and fractional $p$-Laplacian operators respectively, see [6, 9, 11, 15, 28] and references therein. If $\Omega$ is a bounded Lipschitz domain and $1 < p < \infty$, then one has

$$W^{s,p}_{\Omega}(\mathbb{R}^n) = \{ u \in W^{s,p}(\mathbb{R}^n) : u = 0 \text{ in } \Omega^c \},$$

see [9, Proposition B.1]. Moreover, $W^{s,p}_{\Omega}(\mathbb{R}^n) = W_0^{s,p}(\Omega)$ provided $sp \neq 1$, see for instance [6, Proposition B.1].

In the spirit of local case, we introduce what we call variational Sobolev capacity in fractional Sobolev spaces.
Definition 1.1. Let $0 < s < 1$, $p \in [1, \infty)$ and $\Omega \subseteq \mathbb{R}^n$ be an open set. For a compact set $K \subset \Omega$, variational $(s,p)$-Sobolev capacity is defined by

$$\operatorname{Cap}_{s,p}(K, \Omega) := \inf \left\{ [u]^p_{s,p,\Omega} : u \in C^\infty_c(\Omega), \ u \geq 1 \text{ on } K \right\}. \quad (1.5)$$

For an open set $A \subset \Omega$, variational $(s,p)$-Sobolev capacity is defined by

$$\operatorname{Cap}_{s,p}(A, \Omega) = \sup \left\{ \operatorname{Cap}_{s,p}(K, \Omega) : K \subset A, \ K \text{ is compact} \right\},$$

and for an arbitrary set $E \subset \Omega$, variational $(s,p)$-Sobolev capacity is defined by

$$\operatorname{Cap}_{s,p}(E, \Omega) = \inf \left\{ \operatorname{Cap}_{s,p}(A, \Omega) : E \subset A, \ A \text{ is open} \right\}.$$

It is to be noted that by standard approximation argument, we can replace $C^\infty_c(\Omega)$ by $W^{s,p}_0(\Omega)$ in the definition of capacity eq. (1.5).

Remark 1.2. It is worth mentioning that in the definition of capacity (1.5) one can restricts the function $u \in C^\infty_c(\Omega)$ such that $u = 1$ in a neighbourhood $N(K) \subset \Omega$ of $K$ and $0 \leq u \leq 1$ in $\Omega$, see for instance [29, Theorem 2.1].

Definition 1.3. Let $0 < s < 1$, $p \in [1, \infty)$. We say that a property holds $(s,p)$-quasi everywhere (in short $(s,p)$-q.e.) if it holds except for a set of capacity zero.

We say a function $u : \Omega \to \mathbb{R}$ is $(s,p)$-quasi continuous (in short $(s,p)$-q.c.) in $\Omega$ if for every $\epsilon > 0$ there exists an open set $E \subset \Omega$ such that $\operatorname{Cap}_{s,p}(E, \Omega) < \epsilon$ and $u|_{\Omega \setminus E}$ is continuous.

Remark 1.4. It is important to note that from [30, Theorem 2.2] we have the following characterization for $\operatorname{Cap}_{s,p}(K, \Omega)$ via $(s,p)$-q.e. property

$$\operatorname{Cap}_{s,p}(K, \Omega) = \inf \left\{ [u]^p_{s,p,\Omega} : u \in W^{s,p}_0(\Omega), \ u \geq 1 (s,p)\text{-q.e. on } K \right\}.$$
Definition 1.5 (Pointwise fractional $p$-Hardy inequality). Let $0 < s < 1$, $0 \leq \alpha < 1$ and $p \in [1, \infty)$. We say that an open set $\Omega \subseteq \mathbb{R}^n$ with non-empty boundary admits pointwise fractional $p$-Hardy’s inequality if there exist constants $C > 0$ and $\sigma \geq 1$ such that

\[
|u(x)| \leq C \delta(x)^{\frac{n}{p} - \frac{\alpha}{p}} (M_{\alpha, \sigma\delta(x)}(|D^s_p u|)(x))^1/p \quad \text{for all } u \in W^{s,p}_0(\Omega),
\]

and for almost every all $x \in \Omega$, where $|D^s_p u|(x) := \left( \int_{\mathbb{R}^n} \frac{|u(x) - u(y)|^p}{|x - y|^{n+sp}} dy \right)^{\frac{1}{p}}$.

Definition 1.6 (Uniformly $(s, p)$-fat set). Let $0 < s < 1$ and $1 \leq p < \infty$. We say that a closed set $E \subset \mathbb{R}^n$ is uniformly $(s, p)$-fat set if there exists a constant $\gamma > 0$ such that

\[
\text{Cap}_{s,p}(E \cap B_r(x), 2B_r(x)) \geq \gamma \text{Cap}_{s,p}(B_r(x), 2B_r(x)),
\]

for all $x \in E$ and $r > 0$.

Next we consider the following fractional $p$-Laplacian eigenvalue problem on $\Omega \subset \mathbb{R}^n$ open set, $1 < p < \infty$:

\[
\begin{cases}
(-\Delta_p)^s u = \lambda_{s,p}(\Omega) \frac{|u|^{p-2} u}{\delta(x)^{sp}} \quad \text{in } \Omega, \\
u \in W^{s,p}_{\text{loc}}(\mathbb{R}^n), \ u \neq 0,
\end{cases}
\]

where the fractional $p$-Laplacian operator $(-\Delta_p)^s$, defined by

\[
(-\Delta_p)^s u(x) := \lim_{\epsilon \to 0} \int_{\mathbb{R}^n \setminus B_\epsilon(x)} \frac{|u(x) - u(y)|^{p-2}(u(x) - u(y))}{|x - y|^{n+sp}} dy, \ x \in \mathbb{R}^n.
\]

The corresponding minimization problem of eq. (1.7) is

\[
\lambda_{s,p}(\Omega) := \inf_{\substack{u \in W^{s,p}_{\text{loc}}(\mathbb{R}^n) \\setminus \{0\}}} \frac{\int_{\Omega} \frac{|u|^{p}}{\delta(x)^{sp}} dx}{\int_{\Omega} \frac{|u(x)|^p}{\delta(x)^{sp}} dx}.
\]

The tail space $L^{p-1}_{sp}(\mathbb{R}^n)$ (see [24]), defined by

\[
L^{p-1}_{sp}(\mathbb{R}^n) = \left\{ u \in L^{p-1}_{\text{loc}}(\mathbb{R}^n) : \int_{\mathbb{R}^n} \frac{|u(x)|^p}{(1 + |x|)^{n+sp}} dx < \infty \right\}.
\]

Definition 1.7 (see [24]). We say that a function $u \in W^{s,p}_{\text{loc}}(\Omega)$ such that $u_- \in L^{p-1}_{sp}(\mathbb{R}^n)$ is a fractional weak $p$-supersolution of eq. (1.7) if

\[
\int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \frac{|u(x) - u(y)|^{p-2}(u(x) - u(y))\phi(x) - \phi(y))}{|x - y|^{n+sp}} dxdy \geq \lambda_{s,p}(\Omega) \int_{\Omega} \frac{|u(x)|^{p-2}u(x)\phi(x)}{\delta(x)^{sp}} dx,
\]

for all $\phi \in C^\infty_c(\Omega)$ with $\phi \geq 0$. 
**Definition 1.8.** Let $0 < s < 1$ and $1 < p < \infty$. We say that an open subset $\Omega$ of $\mathbb{R}^n$ admits fractional $p$-Hardy’s inequality if there exists an uniform constant $C_H > 0$ such that

\[(1.9) \quad \int_{\Omega} \frac{|u(x)|^p}{\delta(x)^{sp}}dx \leq C_H \int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \frac{|u(x) - u(y)|^p}{|x - y|^{n+sp}} dxdy \quad \text{for all } u \in W^{s,p}_\Omega(\mathbb{R}^n).\]

We remark that very recently, in [13] the authors studied capacitory versions of fractional Poincaré, pointwise, and localized fractional Hardy inequalities in a metric measure space. However, their results involve the Assouad codimension of the domain, and the function is continuous.

Let us now describe our results in this paper before formulating these. **Theorem 1.9** is a capacitory version of the fractional Sobolev–Poincaré inequality, which is motivated by the result of [20], and whereas, **Theorem 1.10** gives a characterization of uniformly $(s,p)$-fat set through a boundary fractional Sobolev–Poincaré type inequality. As an application of **Theorem 1.10**, at the end of section 3, we provide various classes of domains that are uniformly $(s,p)$-fat set. The existence issue regarding fractional $p$-Hardy’s inequality eq. (1.9) in the supercritical case $sp > n$ for any proper open set is addressed in **Theorem 1.11**. This result can be obtained by proving an appropriate pointwise fractional Hardy type inequality and applying the maximal function theorem. Inspired by [21], **Theorem 1.12** gives a characterization of fractional $p$-Hardy’s inequality eq. (1.9) in terms of fractional weak $p$-supersolution of the problem eq. (1.7).

Our main results are stated below.

**Theorem 1.9.** Suppose $u \in W^{s,p}(B)$ be a $(s,p)$-quasi continuous function, where $B = B_r(x_0) \subset \mathbb{R}^n(n \geq 2)$ is an open ball of radius $r > 0$. Let $Z(u) = \{x : u(x) = 0\}$ be the zero set of the function $u$ and $0 < \lambda < 1$. Then there exists a constant $C = C(n,s,p,\lambda) > 0$ such that

\[
\left( \int_{B} |u(x)|^{p^*_s}dx \right)^{\frac{1}{p^*_s}} \leq C \left( \frac{1}{\text{Cap}_{s,p}(Z(u) \cap \lambda \overline{B}, B)} \int_{B} \int_{B} \frac{|u(x) - u(y)|^p}{|x - y|^{n+sp}} dxdy \right)^{\frac{1}{p}},
\]

where $p^*_s = \frac{np}{n-sp}$ is the fractional Sobolev critical exponent, $1 \leq p < \frac{n}{s}$.

**Theorem 1.10.** Let $0 < s < 1$, $p \in [1, \infty)$ such that $sp < n$, and let $\Omega$ be any proper open set in $\mathbb{R}^n(n \geq 2)$. Then $\mathbb{R}^n \setminus \Omega$ is uniformly $(s,p)$-fat set if and only if for any $z \in \mathbb{R}^n \setminus \Omega$, $r > 0$

\[(1.10) \quad \left( \int_{B_r(z)} |u(x)|^{p^*_s}dx \right)^{\frac{1}{p^*_s}} \leq C \left( \int_{B_r(z)} \int_{B_r(z)} \frac{|u(x) - u(y)|^p}{|x - y|^{n+sp}} dxdy \right)^{\frac{1}{p}} \quad \text{for all } u \in C^\infty_c(\Omega),
\]

where $C > 0$ is a constant independent of $r$ and the function $u$.

**Theorem 1.11.** Let $\Omega$ be any open set in $\mathbb{R}^n$ with $\Omega \neq \mathbb{R}^n$. Let $0 < s < 1$ and $p > 1$ such that $sp > n$. Then we have the following

\[
\int_{\Omega} \frac{|u(x)|^p}{\delta(x)^{sp}}dx \leq C \int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \frac{|u(x) - u(y)|^p}{|x - y|^{n+sp}} dxdy \quad \text{for all } u \in C^\infty_c(\Omega),
\]

where $C$ is a positive constant independent of the function. Furthermore,

\[
\int_{\Omega} \frac{|u(x)|^p}{\delta(x)^{sp}}dx \leq C \int_{\Omega} \int_{\Omega} \frac{|u(x) - u(y)|^p}{|x - y|^{n+sp}} dxdy \quad \text{for all } u \in C^\infty_c(\Omega).
\]
Theorem 1.12. Let $0 < s < 1$ and $1 < p < \infty$. Then fractional $p$-Hardy’s inequality eq. (1.9) holds true in $\Omega$ if and only if there exists an eigenvalue $\lambda_{s,p}(\Omega) > 0$ and a positive fractional weak $p$-supersolution $u \in W^{s,p}_{\Omega}(\mathbb{R}^n)$ of eq. (1.7) in $\Omega$.

This paper organized in the following way: In section 2 we collect some known results and discussed some necessary preliminaries. Proofs of theorems 1.9 to 1.11 along with some further results are given in section 3. In section 4 we prove theorem 1.12.

2. Preliminaries and Known results

Throughout the paper we shall assume the following notation s, unless mentioned otherwise explicitly:
- $\Omega$ is an open connected set in $\mathbb{R}^n$, $0 < s < 1$, $1 \leq p < \infty$, $n \in \mathbb{N}$.
- $\overline{\Omega}$ is the closure of $\Omega$.
- $|\Omega|$ is the Lebesgue measure of $\Omega$.
- $u_\Omega = \frac{1}{|\Omega|} \int_\Omega u \, dx$ is the average of the function $u$ in $\Omega$.
- $X^c$ is the complement of the set $X$ in the appropriate universal set.
- $B_r(x)$ is an open ball centered at $x$ of radius $r > 0$.
- $\mathbb{S}^{k-1}$ is the unit sphere in $\mathbb{R}^k$.
- $c, C, C(\ast, \ast, \cdots, \ast) > 0$ denote generic constants that will appear in the estimate and need not be the same as in the preceding steps; the value depends on the quantities indicted by $\ast$’s.

We start with some known results and some technical lemmas that will be required to proof our results.

Lemma 2.1 (Discrete Picone inequality, [7]). Let $p \in (1, \infty)$ and let $f, g : \mathbb{R}^n \to \mathbb{R}$ be two measurable functions with $f \geq 0$, $g > 0$, then $L(f,g) \geq 0$ in $\mathbb{R}^n \times \mathbb{R}^n$, where

$$L(f,g)(x,y) = |f(x) - f(y)|^p - |g(x) - g(y)|^{p-2}(g(x) - g(y))\left(\frac{f(x)^p}{g(x)^{p-1}} - \frac{f(y)^p}{g(y)^{p-1}}\right).$$

The equality holds if and only if $f = \alpha g$ a.e. in $\mathbb{R}^n$ for some constant $\alpha$.

Lemma 2.2 (see [4, Lemma 2.2]). Let $1 < q < \infty$ and $a$, $b \in \mathbb{R}$. Then there exists a constant $C(q) > 0$ such that

$$\left|[a]^{q-2}a - |b|^{q-2}b\right| \leq C(q) \left(|a| + |b|\right)^{q-2}|a - b|.$$ (2.1)

Theorem 2.3 (see [21, 27]). Let $X$ be a reflexive Banach space and $X^*$ denotes the dual space of $X$. If the operator $T : X \to X^*$ satisfies the following conditions:

1. (Boundedness:) $T$ is bounded that is there exists $C > 0$ such that $\|Tf\|_{X^*} \leq C\|f\|_X$, for all $f \in X$.

2. (Demicontinuity:) For all $g \in X$, we have $\langle Tf_k, g \rangle \to \langle Tf, g \rangle$, whenever $f_k \to f$ in $X$, as $k \to \infty$, where $\langle \cdot, \cdot \rangle$ denotes the duality bracket.
(3) **(Coercivity:**) if \( \{f_k\} \) is a sequence in \( X \) with \( \|f_k\|_X \to \infty \), as \( k \to \infty \) then 
\[
\langle Tf_k, f_k \rangle_{k \to \infty} \to \infty.
\]

Then for all \( g \in X^* \) there exists \( u \in X \) such that \( Tu = g \).

**Lemma 2.4** (see [5, Lemma 3.1]). Let \( \Omega \subset \mathbb{R}^n \) be a bounded open set and \( s \in (0,1) \), \( 1 \leq p < \infty \). Then
\[
(2.2) \quad \int_\Omega |u - u_\Omega|^p dx \leq \frac{\text{diam}(\Omega)^{n+sp}}{|\Omega|} \int_\Omega \int_\Omega \frac{|u(x) - u(y)|^p}{|x - y|^{n+sp}} dxdy \quad \text{for all } u \in W^{s,p}(\Omega).
\]

**Lemma 2.5.** Let \( s \in (0,1) \), \( 1 \leq p < \infty \). Then the following properties of capacity hold:

a) **(Ball estimate:**) \( \text{Cap}_{s,p}(B_r(x), 2B_r(x)) = C r^{n-sp} \), for some constant \( C > 0 \).

b) **(Monotonicity:**) If \( K_1 \subseteq K_2 \subset \Omega \), where \( K_i \)'s are compact sets, one has 
\[
\text{Cap}_{s,p}(K_1, \Omega) \leq \text{Cap}_{s,p}(K_2, \Omega).
\]

**Proof.** a) It follows from [29, Theorem 2.2] by choosing the radius of the ball appropriately.
b) It is an immediate consequence of the definition of \( \text{Cap}_{s,p}(\cdot, \Omega) \). \( \square \)

We believe that the following two results are well known to the experts, but we include their proof for completeness.

**Lemma 2.6.** Let \( \Omega \subset \mathbb{R}^n \) be an open set, \( s \in (0,1) \) and \( p \in (0, \infty) \) such that \( sp > 1 \). Then
\[
\int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \frac{|u(x) - u(y)|^p}{|x - y|^{n+sp}} dxdy \leq C \int_\Omega \int_\Omega \frac{|u(x) - u(y)|^p}{|x - y|^{n+sp}} dxdy \quad \text{for all } u \in C^\infty_c(\Omega),
\]
where \( C = C(n, s, p) \) is a positive constant and does not depend on the domain \( \Omega \).

**Proof.** Let \( u \in C^\infty_c(\Omega) \). Then we have
\[
\int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \frac{|u(x) - u(y)|^p}{|x - y|^{n+sp}} dxdy = \int_\Omega \int_\Omega \frac{|u(x) - u(y)|^p}{|x - y|^{n+sp}} dxdy + 2 \int_\Omega |u(x)|^p \left( \int_{\Omega^c} \frac{dy}{|x - y|^{n+sp}} \right) dx.
\]
Note that, for \( x \in \Omega \), we have
\[
\int_{\Omega^c} \frac{dy}{|x - y|^{n+sp}} \leq \int_{\mathbb{R}^{n-1}} dw \int_{d_{w,\Omega}(x)}^\infty dr \frac{dr}{r^{sp+1}} = \frac{1}{sp} \int_{\mathbb{R}^{n-1}} dw \frac{dw}{d_{w,\Omega}(x)^{sp}} = \frac{C(n, s, p)}{m_{sp}(x)^{sp}},
\]
where \( d_{w,\Omega}(x) = \inf\{|t| : x + tw \in \Omega^c\} \) (see, [26]) and 
\[
m_{sp}(x)^{sp} = \frac{2\pi^{n-1}}{\Gamma \left( \frac{1+sp}{2} \right)} \left/ \int_{\mathbb{R}^{n-1}} dw \right. \frac{dw}{d_{w,\Omega}(x)}.
\]
Thus, we obtain
\[ \int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \frac{|u(x) - u(y)|^p}{|x - y|^{n+sp}} \, dx \, dy \leq \int_{\Omega} \int_{\Omega} \frac{|u(x) - u(y)|^p}{|x - y|^{n+sp}} \, dx \, dy + 2C(n, s, p) \int_{\Omega} \frac{|u(x)|^p}{m_{sp}(x)^{sp}} \, dx \]
\[ \leq C(n, s, p) \int_{\Omega} \int_{\Omega} \frac{|u(x) - u(y)|^p}{|x - y|^{n+sp}} \, dx \, dy, \]
where in the last step we have used the fractional Hardy inequality of Loss–Sloane [26, Theorem 1.2]. Hence the lemma follows.

**Lemma 2.7.** Suppose \( u \in L^1_{\text{loc}}(\mathbb{R}^n) \) and let \( 0 < \beta < \infty \). Then there is a constant \( C = C(n, \beta) \) and a set \( A \subset \mathbb{R}^n \) with \( |A| = 0 \) such that
\[ |u(x) - u(y)| \leq C|x - y|^\beta \left( u^\#_{\beta,4|x-y|}(x) + u^\#_{\beta,4|x-y|}(y) \right), \quad \text{for all } x, y \in \mathbb{R}^n \setminus A. \]

**Proof.** Let \( S_u \) be the set of all Lebesgue points of the function \( u \) and set \( A = S_u^c \). Then, by Lebesgue differentiation theorem we have \( |A| = 0 \). Now fix \( x \in S_f, \, 0 < r < \infty \) and we denote \( B_k = B_{\frac{r}{2^k}}(x), \quad k = 0, 1, 2, \cdots \)
\[ |u(x) - u_{B_r}(x)| = \left| \lim_{m \to \infty} \sum_{k=0}^{m} (u_{B_{k+1}} - u_{B_k}) \right| \leq \sum_{k=0}^{\infty} |u_{B_{k+1}} - u_{B_k}| \]
\[ = \sum_{k=0}^{\infty} \frac{1}{|B_{k+1}|} \int_{B_{k+1}} |u(z) - u_{B_k}| \, dz \leq \sum_{k=0}^{\infty} \frac{1}{|B_{k+1}|} \int_{B_{k+1}} |u(z) - u_{B_k}| \, dz \]
\[ \leq \sum_{k=0}^{\infty} \frac{|B_k|}{|B_{k+1}|} \int_{B_k} |u(z) - u_{B_k}| \, dz = C(n) \sum_{k=0}^{\infty} \left( \frac{r}{2^k} \right)^\beta \left( \frac{r}{2^k} \right)^{-\beta} \int_{B_k} |u(z) - u_{B_k}| \, dz \]
\[ \leq C(n, \beta)r^\beta u^\#_{\beta,r}(x). \]

Let \( y \in B_r(x) \setminus A \) and we have \( B_r(x) \subset B_{2r}(y) \). Now
\[ |u(y) - u_{B_r}(x)| \leq |u(y) - u_{B_{2r}(y)}| + |u_{B_{2r}(y)} - u_{B_r}(x)| \]
\[ \leq C_1 r^\beta u^\#_{\beta,2r}(y) + \int_{B_r(x)} |u(z) - u_{B_{2r}(y)}| \, dz \]
\[ \leq C_1 r^\beta u^\#_{\beta,2r}(y) + C_2(n) \int_{B_{2r}(y)} |u(z) - u_{B_{2r}(y)}| \, dz \leq C(n, \beta)r^\beta u^\#_{\beta,2r}(y). \]

Let \( x, y \in \mathbb{R}^n \setminus A \) with \( x \neq y \) and let \( r = 2|x-y| \). Then \( x, y \in B_r(x) \) and hence we have
\[ |u(x) - u(y)| \leq |u(x) - u_{B_r(x)}| + |u(y) - u_{B_r(x)}| \leq C(n, \beta)r^\beta \left( u^\#_{\beta,2r}(x) + u^\#_{\beta,2r}(y) \right). \]
This completes the proof of the lemma.

**Lemma 2.8.** Let \( 0 \leq \alpha < s < 1, \quad R > 0 \). Suppose \( u \in W^{s,p}(\mathbb{R}^n) \). Then for any \( x \in \mathbb{R}^n \) there is a constant \( C \) such that
\[ u^\#_{s-\alpha,R}(x) \leq CM_{\alpha,R} \left( |D^s_p u| \right)(x), \]
where \( |D^s_p u|(x) = \left( \int_{\mathbb{R}^n} \frac{|u(x) - u(y)|^p}{|x - y|^{n+sp}} \, dy \right)^{1/p} \).
Proof. Using Hölder inequality we have

$$|u(y) - u_{B_r(x)}| = \left| u(y) - \frac{1}{|B_r(x)|} \int_{B_r(x)} u(z) dz \right| \leq \frac{1}{|B_r(x)|} \int_{B_r(x)} |u(y) - u(z)| dz \leq \frac{1}{|B_r(x)|^{1/p}} \left( \int_{B_r(x)} |u(y) - u(z)|^p |y - z|^{n+sp} dz \right)^{1/p}.$$ 

Integrating over the ball $B_r(x)$ we obtain

$$\int_{B_r(x)} |u(y) - u_{B_r(x)}| dy \leq \frac{C r^{n+sp}}{|B_r(x)|^{1/p}} \left( \int_{B_r(x)} |u(y) - u(z)|^p |y - z|^{n+sp} dz \right)^{1/p} dy \leq \frac{C r^{n+sp}}{|B_r(x)|^{1/p}} \int_{B_r(x)} |D^s_p u(y)| dy \leq C r^{s-\alpha} r^\alpha \int_{B_r(x)} |D^s_p u(y)| dy.$$ 

Thus we get

$$r^{\alpha-s} \int_{B_r(x)} |u((y) - u_{B_r(x)}| dy \leq C r^\alpha \int_{B_r(x)} |D^s_p u(y)| dy,$$ 

and consequently we have

$$u_{s-\alpha,R}(x) \leq CM_{n,R} (|D^s_p u|)(x), \text{ for any } x \in \mathbb{R}^n \text{ and } R > 0.$$ 

By the above two lemmas we obtain the following result.

**Corollary 2.9.** Let $u \in W^{s,p}_loc(\mathbb{R}^n)$ and $0 \leq \alpha < s < 1$. Then, there is a set $A \subset \mathbb{R}^n$ with $|A| = 0$ such that for all $x, y \in \mathbb{R}^n \setminus A$ we have

$$|u(x) - u(y)| \leq C|x - y|^{s-\alpha} (M_{\alpha,|x-y|}(|D^s_p u|)(x) + M_{\alpha,|x-y|}(|D^s_p u|)(y)),$$ 

where $C$ is a positive constant independent of the function $u$.

### 3. On Sobolev-Poincaré and Localized Hardy Inequalities

This section is devoted to proofs of theorems 1.9 to 1.11. We also address some further results in this context.

**Proof of theorem 1.9.** If $u_B = \int_B u = 0$. Then, applying improved fractional Sobolev–Poincaré inequality (see, [19, 30]) for $B_r(x_0)$ we have

$$\left( \int_B |u(x)|^p dx \right)^{\frac{1}{p}} \leq C^{r^{sp-n}} \int_B \left| u(x) - u(y) \right|^p \frac{dx dy}{|x - y|^{n+sp}}.$$ 

Using the capacity estimate lemma 2.5 we get

$$\text{Cap}_{s,p}(Z(u) \cap \lambda B, B) \leq \text{Cap}_{s,p}(\lambda B, B) = C(n, p, \lambda)r^{n-sp}.$$ 

By exploiting this estimate in eq. (3.1) to get the desired result in this case.
If \( u_B \neq 0 \), without loss of generality we can take \( u_B = 1 \). Choose \( \phi \in C^\infty_c(B) \) such that \( \phi = 1 \) in \( \lambda \mathring{B} \), \( |\nabla \phi| \leq c/r \) and \( 0 \leq \phi \leq 1 \). We define \( \psi = \phi(u_B - u) \). Clearly, \( \psi \in W^{s,p}_0(B) \) be a \( (s,p) \)-quasi continuous function and \( \psi = 1 \) in \( Z(u) \cap \lambda \mathring{B} \). Therefore we obtain

\[
\text{Cap}_{s,p}(Z(u) \cap \lambda \mathring{B}, B) \leq \int_B \int_B \frac{|\psi(x) - \psi(y)|^p}{|x - y|^{n+sp}} \, dx \, dy
\]

\[
\leq 2^{p-1} \int_B \int_B \frac{|\phi(x)|^p |u(x) - u(y)|^p}{|x - y|^{n+sp}} \, dx \, dy + \int_B \int_B \frac{|u_B - u(y)|^p |\phi(x) - \phi(y)|^p}{|x - y|^{n+sp}} \, dx \, dy
\]

\[
\leq 2^{p-1} \int_B \int_B \frac{|u(x) - u(y)|^p}{|x - y|^{n+sp}} \, dx \, dy + 2^{p-1} \int_B |u(y) - u_B|^p \int_{B \cap \{|x-y| \leq \eta\}} \frac{|\phi(x) - \phi(y)|^p}{|x - y|^{n+sp}} \, dx \, dy
\]

\[
=: 2^{p-1} \int_B \int_B \frac{|u(x) - u(y)|^p}{|x - y|^{n+sp}} \, dx \, dy + 2^{p-1}(I_1 + I_2),
\]

where \( \eta > 0 \) will be chosen later,

\[ I_1 := \int_B |u(y) - u_B|^p \int_{B \cap \{|x-y| \leq \eta\}} \frac{|\phi(x) - \phi(y)|^p}{|x - y|^{n+sp}} \, dx \, dy, \]

and

\[ I_2 := \int_B |u(y) - u_B|^p \int_{B \cap \{|x-y| > \eta\}} \frac{|\phi(x) - \phi(y)|^p}{|x - y|^{n+sp}} \, dx \, dy. \]

We estimate the above integrals \( I_1, I_2 \) in the following:

**Estimate for \( I_1 \) :** Using the properties of the function \( \phi \), we have

\[
I_1 = \int_B |u(y) - u_B|^p \int_{B \cap \{|x-y| \leq \eta\}} \frac{|\phi(x) - \phi(y)|^p}{|x - y|^{n+sp}} \, dx \, dy
\]

\[
\leq \frac{c^p}{r^p} \int_B |u(y) - u_B|^p \int_{B \cap \{|x-y| \leq \eta\}} \frac{dx}{|x - y|^{n+sp-p}} \, dy
\]

\[
\leq c^p r^{-p} \int_B |u(y) - u_B|^p \int_{|x-y| \leq \eta} \frac{dx}{|x - y|^{n+sp-p}} \, dy \leq C r^{-sp} \int_B |u(y) - u_B|^p \, dy.
\]

**Estimate for \( I_2 \) :**

\[
I_2 = \int_B |u(y) - u_B|^p \int_{B \cap \{|x-y| > \eta\}} \frac{|\phi(x) - \phi(y)|^p}{|x - y|^{n+sp}} \, dx \, dy
\]

\[
\leq 2^p \int_B |u(y) - u_B|^p \int_{B \cap \{|x-y| > \eta\}} \frac{dx}{|x - y|^{n+sp}} \, dy
\]

\[
\leq 2^p \int_B |u(y) - u_B|^p \int_{|x-y| > \eta} \frac{dx}{|x - y|^{n+sp}} \, dy \leq C \eta^{-sp} \int_B |u(y) - u_B|^p \, dy.
\]

Plugging the above two estimates in eq. (3.2), we obtain
\[ \text{Cap}_{s,p}(Z(u) \cap \lambda B, B) \leq 2^{p-1} \int_B \int_B \frac{|u(x) - u(y)|^p}{|x-y|^{n+sp}} \, dx \, dy + 2^{p-1} C \left( \frac{\eta^p - sp}{r^p} + \eta^{-sp} \right) \int_B |u(y) - u_B|^p \, dy. \]

Now, choose \( \eta = r \) the radius of the ball \( B \) and by fractional Poincaré–Wirtinger inequality eq. (2.2) we have

\[ \text{Cap}_{s,p}(Z(u) \cap \lambda B, B) \leq C \int_B \int_B \frac{|u(x) - u(y)|^p}{|x-y|^{n+sp}} \, dx \, dy. \]

Therefore, by above estimate we get

\[ u_B = 1 \leq C \left( \text{Cap}_{s,p}(Z(u) \cap \lambda B, B)^{-1} \int_B \int_B \frac{|u(x) - u(y)|^p}{|x-y|^{n+sp}} \, dx \, dy \right)^{\frac{1}{p}}. \tag{3.3} \]

Now using the estimate eq. (3.3) together with improved fractional Sobolev–Poincaré inequality (see, \cite{19, 30}), we have

\[
\left( \int_B |u(x)|^r \, dx \right)^{\frac{1}{r}} \leq C r^{-s-\frac{n}{p}} \left( \int_B \int_B \frac{|u(x) - u_B|^p}{|x-y|^{n+sp}} \, dx \, dy \right)^{\frac{1}{p}} + C \left( \text{Cap}_{s,p}(Z(u) \cap \lambda B, B)^{-1} \int_B \int_B \frac{|u(x) - u(y)|^p}{|x-y|^{n+sp}} \, dx \, dy \right)^{\frac{1}{p}}
\]

\[
\leq C \left( \frac{1}{\text{Cap}_{s,p}(Z(u) \cap \lambda B, B)} \int_B \int_B \frac{|u(x) - u(y)|^p}{|x-y|^{n+sp}} \, dx \, dy \right)^{\frac{1}{p}}.
\]

In the last estimate we used lemma 2.5. This completes the proof of the theorem.

**Remark 3.1.** Theorem 1.9 is essentially the best possible in the following way: Let \( 1 \leq p < s/n \) and \( F \subset \mathbb{R}^n \) closed set. Take \( x_0 \in F \) be any and consider the ball \( B_r(x_0) \) with \( r > 0 \) small enough. Suppose there exists \( C_F > 0 \) such that

\[
\left( \int_{B_r(x_0)} |u|^p \right)^{1/p} \leq C_F \left( \int_{B_r(x_0)} \int_{B_r(x_0)} \frac{|u(x) - u(y)|^p}{|x-y|^{n+sp}} \, dx \, dy \right)^{1/p},
\]

where \( u \in W^{s,p}(B_r(x_0)) \) is a \((s,p)\)-quasi continuous function with \( u = 0 \) in \( F \cap \frac{1}{2} B_r(x_0) \). Let \( v \in W^{s,p}_0(\frac{1}{2} B_r(x_0)) \) be a \((s,p)\)-quasi continuous function with \( v = 1 \) in \( F \cap \frac{1}{2} B_r(x_0) \). Define \( w := 1 - v \in W^{s,p}(B_r(x_0)) \). Then \( w \) is a \((s,p)\)-quasi continuous function and \( w = 0 \) in \( F \cap \frac{1}{2} B_r(x_0) \). Hence,

\[
C_F \left( \int_{B_r(x_0)} \int_{B_r(x_0)} \frac{|v(x) - v(y)|^p}{|x-y|^{n+sp}} \, dx \, dy \right)^{\frac{1}{p}}
\]
we have 

\[ \text{Theorem 1.10} \]

and 

\[ \text{Lemma 2.5} \]

Then by hypothesis (1.10) we obtain

\[ \lambda |\lambda B_r(z)|^{\frac{1}{p^*}} \leq \left( \int_{\lambda B_r(z)} |u(x)|^{p^*} \, dx \right)^{\frac{1}{p^*}} \leq C r^{sp} \int_{B_r(z)} |u(x)|^p \, dx \]

\[ \leq C \left( \int_{\lambda B_r(z)} \int_{\lambda B_r(z)} \frac{|u(x) - u(y)|^p}{|x-y|^{n+sp}} \, dx \, dy \right)^{\frac{1}{p}} \]

and consequently we obtain

\[ \int_{B_r(z)} \int_{B_r(z)} \frac{|u(x) - u(y)|^p}{|x-y|^{n+sp}} \, dx \, dy \geq C(n, p, s, \lambda) r^{n-sp}. \]

\[ \text{Step 2: If} \]

\[ \int_{\lambda B_r(z)} |u(x)|^{p^*} < \lambda^{p^*}. \]

Note that

\[ 1 = \int_{\lambda B_r(z)} dx = \int_{\lambda B_r(z)} |1 - u(x) + u(x)|^{p^*} \, dx \]

\[ \leq 2^{p^* - 1} \left( \int_{\lambda B_r(z)} |1 - u(x)|^{p^*} \, dx + \int_{\lambda B_r(z)} |u(x)|^{p^*} \, dx \right), \]

and this yields that

\[ \int_{\lambda B_r(z)} |1 - u(x)|^{p^*} \, dx \geq 2^{1-p^*} - \int_{\lambda B_r(z)} |u(x)|^{p^*} \, dx \geq 2^{1-p^*} - \lambda^{p^*} = C(n, s, p, \lambda) > 0. \]
Hence
\[(3.4)\quad \int_{\lambda B_r(z)} |1 - u(x)|^{p^*} \, dx \geq C(n, s, p, \lambda) r^n.\]

Now we choose a cut-off function \(\phi \in C_c^\infty(B_r(z))\) such that \(\phi(x) = 1\) for every \(x \in \lambda B_r(z)\) and define \(f := \phi(1 - u)\). Then, clearly \(\text{Supp}(f) \subset \Omega\) and \(f \in C_c^\infty(\Omega)\). Thus, by eq. (3.4) and then applying the hypothesis eq. (1.10) for \(f\) we obtain

\[C(n, s, p, \lambda) r^n \leq \left( \int_{\lambda B_r(z)} |1 - u(x)|^{p^*} \, dx \right)^{\frac{1}{p^*}} = \left( \int_{\lambda B_r(z)} |f(x)|^{p^*} \, dx \right)^{\frac{1}{p^*}} \leq C_1 \left( \int_{\lambda B_r(z)} \int_{\lambda B_r(z)} \frac{|f(x) - f(y)|^p}{|x - y|^{n+sp}} \, dxdy \right)^{\frac{1}{p}} = C_1 \left( \int_{\lambda B_r(z)} \int_{\lambda B_r(z)} \frac{|u(x) - u(y)|^p}{|x - y|^{n+sp}} \, dxdy \right)^{\frac{1}{p}},\]

and consequently we have
\[\int_{B_r(z)} \int_{B_r(z)} \frac{|u(x) - u(y)|^p}{|x - y|^{n+sp}} \, dxdy \geq C(n, s, p, \lambda) r^{n-sp}.\]

Thus, taking infimum over all such functions \(u\) to get the required result in this case. This completes the proof of the theorem. \(\square\)

**Proof of theorem 1.11.** Let us choose \(q \geq 1\) such that \(n < sq < sp\). Now fix \(x \in \Omega\) and \(x_0 \in \partial \Omega\) such that \(|x - x_0| = \text{dist}(x, \partial \Omega) = \delta(x) = R\). We denote \(\chi = \chi_{B_{2R}(x_0)}\) the characteristic function of \(B_{2R}(x_0)\). Let \(u \in C_c^\infty(\Omega)\), then by **corollary 2.9** we have
\[(3.5)\quad |u(x)| = |u(x) - u(x_0)| \leq C|x - x_0|^\frac{n}{q} \left( M_q(|D_p^s u \chi|)(x) + M_q(|D_p^s u \chi|)(x_0) \right).\]

Using Hölder inequality we have
\[\frac{r^n}{|B_r(x)|} \int_{B_r(x)} (|D_p^s u \chi|)(y) \, dy \leq \frac{r^n}{|B_r(x)|^{1/q}} \left( \int_{B_r(x)} (|D_p^s u \chi|)(y) \, dy \right)^{1/q} \leq C(n) \left( \int_{\mathbb{R}^n} (|D_p^s u \chi|)(y) \, dy \right)^{1/q},\]

and consequently we get
\[M_q(|D_p^s u \chi|)(x) \leq C(n) \||D_p^s u \chi||_{L^q(\mathbb{R}^n)}.\]

Similar computation yields that
\[M_q(|D_p^s u \chi|)(x_0) \leq C(n) \||D_p^s u \chi||_{L^q(\mathbb{R}^n)}.\]

Combining the above two estimates in eq. (3.5) we obtain
\[|u(x)| \leq C|x - x_0|^\frac{n}{q} \left( \int_{B_{2R}(x_0)} (|D_p^s u \chi|)(z) \, dz \right)^{1/q}.\]
\begin{align*}
\leq C R^{s-\frac{\alpha}{p}} \left( \mathbb{P}^{\alpha-n} \int_{B_M(x)} (|D_p u(z)|^q)^{\frac{n}{q}} \right)^{1/q} \\
\leq C (\text{dist}(x, \partial \Omega))^{s-\frac{\alpha}{q}} (M_{\alpha,3R}(|D_p u|)^q(x))^{1/q}.
\end{align*}

Integrating with respect to the variable $x$ over $\Omega$ with $\alpha = 0$, we infer that
\begin{align*}
\int_{\Omega} \frac{|u(x)|^p}{\text{dist}(x, \partial \Omega)^{sp}} dx &\leq C \int_{\Omega} (M(|D_p u|)^q(x))^{\frac{n}{q}} dx \\
&\leq C \int_{\mathbb{R}^n} |D_p u|^p(x) dx \\
&= C \int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \frac{|u(x) - u(y)|^p}{|x - y|^{n+sp}} dxdy.
\end{align*}

In the above estimate we used the Hardy-Littlewood-Wiener maximal function theorem. This proved the first part of theorem 1.11. The second part follows from the first part together with lemma 2.6. This completes the proof of the theorem. \hfill \Box

**Corollary 3.2.** Suppose $u \in W^{s,p}(B)$ be a $(s,p)$-quasi continuous function, where $B = B_r(x_0)$. Let $Z(u) = \{x : u(x) = 0\}$ be the zero set of the function $u$ and $0 < \lambda < 1$. Then there exists a constant $C$ such that
\begin{align*}
\int_B |u(x)|^p dx \leq \frac{C}{Cap_{s,p}(Z(u) \cap \lambda B, B)} \int_B \int_B \frac{|u(x) - u(y)|^p}{|x - y|^{n+sp}} dxdy.
\end{align*}

**Proof.** We proceed exactly same as it is done in the proof of theorem 1.9 with necessary changes. \hfill \Box

**Corollary 3.3.** Let $0 < s < 1$ and $1 \leq p < \infty$. Let $\Omega$ be any proper open set in $\mathbb{R}^n$. Then $\mathbb{R}^n \setminus \Omega$ is uniformly $(s,p)$-fat set if and only if there exists a constant $C > 0$ such that
\begin{align*}
\int_{B_r(z)} |u(x)|^p dx \leq CR^{sp} \int_{B_r(z)} \int_{B_r(z)} \frac{|u(x) - u(y)|^p}{|x - y|^{n+sp}} dxdy,
\end{align*}
for any $z \in \mathbb{R}^n \setminus \Omega$, $r > 0$ and $u \in C_c^\infty(\Omega)$.

**Proof.** We proceed exactly same as it is done in the proof of theorem 1.10 with necessary changes. \hfill \Box

**Theorem 3.4.** Let $0 < s < 1$, $1 \leq p < \infty$ such that $sp \leq n$, $0 \leq \alpha < p$, and let $\Omega$ be an open set in $\mathbb{R}^n$ such that it’s complement that is $\mathbb{R}^n \setminus \Omega$ is uniformly $(s,p)$-fat. Assume that $u \in C_c^\infty(\Omega)$. Then pointwise fractional $p$-Hardy inequality eq. (1.6) holds true for $\Omega$ that there exist constants $C = C(n,p,\alpha) > 0$ and $\sigma > 1$ such that for all $x \in \Omega$
\begin{align*}
|u(x)| \leq C \delta(x)^{\frac{s-\alpha}{p}} \left( M_{\alpha, \sigma \delta(x)} |D_p u|^p(x) \right)^{\frac{1}{p}}.
\end{align*}

**Proof.** Let $x \in \Omega$. Let us choose $x_0 \in \partial \Omega$ for which $|x - x_0| = \delta(x) = R$. Then, by using the standard telescoping argument as in the proof of lemma 2.7 we obtain
\begin{align*}
|u(x) - u_{BR(x_0)}| \leq CR^{s-\frac{\alpha}{p}} \left( M_{\alpha, 2R} |D_p u|^p(x) \right)^{\frac{1}{p}}.
\end{align*}
Thus, by above estimate we have
\begin{align*}
(3.6) \quad |u(x)| \leq |u(x) - u_{BR(x_0)}| + |u_{BR(x_0)}| \leq CR^{s-\frac{\alpha}{p}} \left( M_{\alpha, 2R} |D_p u|^p(x) \right)^{\frac{1}{p}} + |u_{BR(x_0)}|.
\end{align*}
Now consider the set $Z(u) = \{ x \in \mathbb{R}^n : u(x) = 0 \}$. Then by using Corollary 3.2 and the monotonicity property of the capacity along with hypothesis, we obtain

\begin{equation}
|u_{B_{R}(x_0)}| \leq \left( C \text{ Cap}_{s,p}(Z(u) \cap \lambda B, B)^{-1} \int_{B_{R}(x_0)} |D_{p}^{s} u|^p dx \right)^{\frac{1}{p}}
\end{equation}

\begin{equation}
\leq \left( C \text{ Cap}_{s,p}(\Omega^{c} \cap \lambda B, B)^{-1} \int_{B_{R}(x_0)} |D_{p}^{s} u|^p dx \right)^{\frac{1}{p}}
\end{equation}

\begin{equation}
\leq C \left( R^{sp-n} \int_{B_{R}(x_0)} |D_{p}^{s} u|^p dx \right)^{\frac{1}{p}} \leq C R^{sp-n} (M_{\alpha,R} |D_{p}^{s} u|^p(x))^{\frac{1}{p}}.
\end{equation}

Plugging the estimate eq. (3.7) into eq. (3.6) we obtain

\begin{equation}
|u(x)| \leq C R^{sp-n} (M_{\alpha,R} |D_{p}^{s} u|^p(x))^{\frac{1}{p}}.
\end{equation}

Since we have chosen $x \in \Omega$ arbitrarily and hence this completes the proof of the theorem. □

**Example 3.5.** For $s \in (0,1)$, $1 < p < \infty$. Then all nonempty closed sets in $\mathbb{R}^n$ are uniformly $(s,p)$-fat set.

**Proof.** Suppose $E \subset \mathbb{R}^n$ be an nonempty closed set. Let $x \in E$ and $r > 0$. Consider $u \in C^{\infty}_c(2B_r(x))$ such that $u \geq 1$ in $E \cap B_r(x)$. Choose a cutoff function $\rho \in C^{\infty}_c(3B_r(x))$ such that $0 \leq \rho \leq 1$, $\rho = 1$ in $B_r(x)$ and $|\nabla \rho| \leq c/r$. Then, by fractional Morrey’s inequality (see, [8, Corollary 2.7]) we have

\begin{equation}
| (pu)(y) - (pu)(z) | \leq C |y - z|^s \rho^{sp} [pu]_{s,p,\mathbb{R}^n}.
\end{equation}

Now, let $y \in E \cap B_r(x)$ and $z \in B_{3r}(x) \setminus B_{2r}(x)$. Then, we have $(pu)(y) \geq 1$ and $(pu)(z) = 0$. Thus by eq. (3.8), we obtain

\begin{equation}
[pu]_{s,p,\mathbb{R}^n} \geq C |y - z|^{n-sp} | (pu)(y) - (pu)(z) | \geq Cr^{n-sp}.
\end{equation}

Therefore, using Lemma 2.6 and eq. (3.9) we have

\begin{equation}
[pu]_{s,p,B_{2r}(x)} \geq C r^{n-sp}.
\end{equation}

Also, note that

\begin{equation}
[pu]_{s,p,B_{2r}(x)} = \int_{B_{2r}(x)} \int_{B_{2r}(x)} | (pu)(y) - (pu)(z) |^p dydz
\end{equation}

\begin{equation}
= \int_{B_{2r}(x)} \int_{B_{2r}(x)} |\rho(y)(u(y) - u(z)) + u(z)(\rho(y) - \rho(z)) |^p dydz
\end{equation}

\begin{equation}
\leq 2^{p-1} \left( \int_{B_{2r}(x)} \int_{B_{2r}(x)} |u(y) - u(z)|^p dydz + \frac{C}{r^p} \int_{B_{2r}(x)} \int_{B_{4r}(z)} |u(z)|^p dydz \right).
\end{equation}
\[
\leq 2^{p-1} \left( \int_{B_{2r}(x)} \int_{B_{2r}(x)} \frac{|u(y) - u(z)|^p}{|y - z|^{n+sp}} dy dz + \frac{C}{r^{sp}} \int_{B_{2r}(x)} |u(z)|^p dz \right)
\leq C \int_{B_{2r}(x)} \int_{B_{2r}(x)} \frac{|u(y) - u(z)|^p}{|y - z|^{n+sp}} dy dz.
\]

In the last estimate we have used the fractional Poincaré inequality (see, \cite{6}) and then lemma \textit{2.6}. Now, combining the estimates eq. (3.10), eq. (3.11) we obtain
\[
\int_{B_{2r}(x)} \int_{B_{2r}(x)} \frac{|u(y) - u(z)|^p}{|y - z|^{n+sp}} dy dz \geq Cr^{n-sp}.
\]

Since \( u \) is arbitrary and thus taking infimum over all such functions to get the desired result. \( \square \)

**Example 3.6.** Let \( 0 < s < 1 \) and \( 1 \leq p < \infty \). Suppose \( E \subset \mathbb{R}^n \) be a closed set such it satisfies the measure density condition
\[
(3.12) \qquad |E \cap B_r(x)| \geq c |B_r(x)|,
\]
for all \( x \in E \) and radii \( r > 0 \), and for some constant \( c > 0 \). Then \( E \) is uniformly \((s,p)\)-fat set.

**Proof.** Let \( x \in E \). Set \( K = E \cap \overline{B_r(x)} \). Let \( u \in C_c^\infty (B_{2r}(x)) \) such that \( 0 \leq u \leq 1 \), \( u = 1 \) in \( K \). Then, we have
\[
0 \leq u_{4B_r(x)} = \int_{4B_r(x)} u < 1.
\]

Then, by above we obtain \( |u(y) - u_{4B_r(x)}| = 1 - u_{4B_r(x)} = C > 0 \) for \( y \in K \). Now using the measure density condition eq. (3.12) and the fractional Poincaré–Wirtinger inequality eq. (2.2) we obtain
\[
C|B_r(x)| \leq |K| \leq C(p) \int_K |u(y) - u_{4B_r(x)}|^p dy \leq C(p) \int_{4B_r(x)} |u(y) - u_{4B_r(x)}|^p dy
\leq C r^{sp} \int_{4B_r(x)} \int_{4B_r(x)} \frac{|u(y) - u(z)|^p}{|y - z|^{n+sp}} dy dz.
\]

Now, in the right hand side of the above we make change the variables to get the required result. \( \square \)

4. Nonlocal eigenvalue problem

In this section we present the proof of \textit{theorem 1.12}.

**Proof of \textit{theorem 1.12}**. Suppose we have a fractional weak \( p \)-supersolution \( u \in W^{s,p}_\Omega (\mathbb{R}^n) \) of eq. (1.7) which is positive in \( \Omega \). Let \( v \in C_c^\infty (\Omega) \). Without loss of generality we may assume that \( v \geq 0 \) in \( \Omega \). Define \( \phi = \frac{v^p}{u^p} \). We claim that the function \( \phi \) is an admissible test function. In order to prove this, let \( \{\rho_k\} \) be the standard mollifiers in \( \mathbb{R}^n, k \in \mathbb{N} \). Define \( \phi_k = \frac{v^p}{u_k^p} \), where \( u_k = u * \rho_k \).

Then \( \phi_k \in C_c^\infty (\Omega) \). Moreover, as \( u > 0 \) in \( \Omega \), we have \( u_k > 0 \) in \( \Omega \) for any \( k \). Also, note that there exists \( \alpha > 0 \) such that \( u, u_k > \alpha \) in \( \text{Supp}(v) \). Therefore, for all \( x, y \in \text{Supp}(v) \),
\[
|\phi_k(x) - \phi_k(y)| = \left| \frac{v(x)^p}{u_k(x)^{p-1}} - \frac{v(y)^p}{u_k(y)^{p-1}} \right|
\]
holds true for $\Omega$ with $p$ and let $\phi \in L^p(\Omega)$, we then have
\[ u_k(x) - u_k(y) \leq C(p, \alpha, \|\phi\|_\infty) (|v(x) - v(y)| + |u_k(x) - u_k(y)|). \]
Thus, we obtain
\[
\int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \frac{|\phi_k(x) - \phi_k(y)|^p}{|x - y|^{n+sp}} \, dx \, dy \leq C(p, \alpha, \|\phi\|_\infty) \left( \int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \frac{|v(x) - v(y)|^p}{|x - y|^{n+sp}} \, dx \, dy + \int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \frac{|u_k(x) - u_k(y)|^p}{|x - y|^{n+sp}} \, dx \, dy \right).
\]
Since, $u_k \to u$ in $W^{s,p}_\Omega(\mathbb{R}^n)$ (see, [16, Lemma 11]) and $u_k(x) \to u(x)$ pointwise, as $k \to \infty$. Then, by generalized dominated convergence theorem to ensure that $\phi \in W^{s,p}_\Omega(\mathbb{R}^n)$. Hence the claim follows. Now by eq. (1.8) with $\phi$ as a test function and using discrete Picone inequality lemma 2.1 we obtain
\[
\lambda_{s,p}(\Omega) \int_\Omega \frac{u(x)^{p-1}}{\delta(x)^{sp}} \, dx = \lambda_{s,p}(\Omega) \int_\Omega \frac{u(x)^{p-1} \phi(x)}{\delta(x)^{sp}} \, dx \leq \int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \frac{|u(x) - u(y)|^{p-2} (u(x) - u(y)) (\phi(x) - \phi(y))}{|x - y|^{n+sp}} \, dx \, dy \leq \int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \frac{|v(x) - v(y)|^p}{|x - y|^{n+sp}} \, dx \, dy,
\]
and this yields that
\[
\lambda_{s,p}(\Omega) \int_\Omega \frac{v(x)^p}{\delta(x)^{sp}} \, dx \leq \int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \frac{|v(x) - v(y)|^p}{|x - y|^{n+sp}} \, dx \, dy.
\]
Thus, we conclude that the fractional $p$-Hardy inequality eq. (1.9) holds true for $\Omega$ with $C_H = \frac{1}{\lambda_{s,p}(\Omega)}$.
To prove other implication, suppose that the domain $\Omega$ admits the fractional $p$-Hardy’s inequality eq. (1.9) and let $\lambda_{s,p}(\Omega) < \frac{1}{C_H}$. Consider the following space
\[ X = \left\{ u \in W^{s,p}_{\text{loc}}(\Omega) : \frac{u}{\delta(x)^s} \in L^p(\Omega), [u]_{s,p,\mathbb{R}^n}^p < \infty \right\}, \]
endowed with the norm
\[ ||u||_X = ||u \delta(x)^{-s}||_{L^p(\Omega)} + [u]_{s,p,\mathbb{R}^n}. \]
Since the domain $\Omega$ admits the fractional $p$-Hardy’s inequality eq. (1.9), we then have $W^{s,p}_\Omega(\mathbb{R}^n) = X$ in the sense of equivalent norms. The operator $T : X \to X^*$ is defined by
\[ \langle Tu, \phi \rangle = \int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \frac{|u(x) - u(y)|^{p-2}(u(x) - u(y))(\phi(x) - \phi(y))}{|x - y|^{n+sp}} \, dx \, dy - \lambda_{s,p}(\Omega) \int_{\Omega} \frac{|u(x)|^{p-2}u(x)\phi(x)}{\delta(x)^{sp}} \, dx, \text{ for } u, \phi \in X. \]

(1) **Boundedness:** By Hölder inequality we obtain

\[
||Tu||_{X^*} = \sup_{||v||_{X^*} \leq 1} |\langle Tu, v \rangle| \\
\leq \sup_{||v||_{X^*} \leq 1} \left\{ \int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \frac{|u(x) - u(y)|^{p-1}|v(x) - v(y)|}{|x - y|^{n+sp}} \, dx \, dy + \lambda_{s,p}(\Omega) \int_{\Omega} \frac{|u(x)|^{p-1}|v(x)|}{\delta(x)^{sp}} \, dx \right\} \\
\leq \sup_{||v||_{X^*} \leq 1} \left\{ \int_{\mathbb{R}^n} \int_{\mathbb{R}^n} |u(x)|^{p-2}u_k(x) - |u(x)|^{p-2}u(x) g(x) \delta(x)^{sp} \, dx \right\} \\
\leq \left( \int_{\mathbb{R}^n} \int_{\mathbb{R}^n} |U_k(x,y)|^{p-1} \, dx \, dy \right)^{\frac{p}{p-1}} \left( \int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \frac{|g(x)|^{p}}{\delta(x)^{sp}} \, dx \right)^{\frac{p-1}{p}} \\
+ \lambda_{s,p}(\Omega) \left( \int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \frac{|U_k(x,y)|^{p-1}u_k(x) - |u(x)|^{p-2}u(x) \delta(x)^{sp}}{\delta(x)^{sp}} \, dx \right)^{\frac{p-1}{p}} \\
\leq ||g||_X \left( \int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \frac{|U_k(x,y)|^{p-1}u_k(x) - |u(x)|^{p-2}u(x) \delta(x)^{sp}}{\delta(x)^{sp}} \, dx \right)^{\frac{p-1}{p}} \\
+ \lambda_{s,p}(\Omega) \left( \int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \frac{|u_k(x)|^{p-2}u_k(x) - |u(x)|^{p-2}u(x) \delta(x)^{sp}}{\delta(x)^{sp}} \, dx \right)^{\frac{p-1}{p}} \\
=: ||g||_X (I_1 + \lambda_{s,p}(\Omega)I_2),
\]

Therefore, \( T \) is bounded.

(2) **Demicontinuity:** Let \( \{u_k\} \) be a sequence of functions in \( X \) which converges to \( u \) in \( X \). For \( g \in X \), by Hölder inequality we obtain
where $U_k(x, y) = |u_k(x) - u_k(y)|^{p-2}(u_k(x) - u_k(y))$, $U(x, y) = |u(x) - u(y)|^{p-2}(u(x) - u(y))$ and
\[
I_1 := \left( \int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \frac{|U_k(x, y) - U(x, y)|^{p-1}}{|x - y|^{n+sp}} \, dx \, dy \right)^{\frac{p}{p-1}},
\]
\[
I_2 := \left( \int_{\Omega} |u_k(x)|^{p-2}u_k(x) - |u(x)|^{p-2}u(x) \frac{\delta(x)^{sp}}{\delta(x)^{sp}} \, dx \right)^{\frac{p}{p-1}}.
\]
We shall estimate the integrals $I_1$, $I_2$ in the following:

**Estimate for $I_1$:** Using eq. (2.1) we obtain
\[
I_1^{\frac{p}{p-1}} \leq C \int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \frac{\Sigma_k(x, y)}{|x - y|^{n+sp}} \, dx \, dy,
\]
where
\[
\Sigma_k(x, y) := (|u_k(x) - u_k(y)| - (u(x) - u(y)))^{\frac{p}{p-1}}(|u_k(x) - u_k(y)| + |u(x) - u(y)|)^{\frac{p(p-2)}{p-1}}.
\]
Using Hölder inequality with the exponents $p - 1$ and $\frac{p-1}{p-2}$, and then by convexity we obtain
\[
I_1^{\frac{p}{p-1}} \leq C[u_k - u]_{s,p,\mathbb{R}^n}^p [u_k]_{s,p,\mathbb{R}^n}^{p-2} \leq C||u_k - u||_{X}^p (||u||_{X}^p + ||u||_{X}^{p-2}).
\]

**Estimate for $I_2$:** Similarly as above we get
\[
I_2^{\frac{p}{p-1}} \leq C \int_{\Omega} \frac{|u_k(x) - u(x)|^{p-1}(|u_k(x)| + |u(x)|)^{\frac{p(p-2)}{p-1}}}{\delta(x)^{sp}} \, dx
\]
\[
\leq C \left( \int_{\Omega} \frac{|u_k(x) - u(x)|^p}{\delta(x)^{sp}} \, dx \right)^{\frac{1}{p-1}} \left( \int_{\Omega} \frac{|u_k(x)|^p}{\delta(x)^{sp}} \, dx + \int_{\Omega} \frac{|u(x)|^p}{\delta(x)^{sp}} \, dx \right)^{\frac{p-2}{p-1}}
\]
\[
\leq C||u_k - u||_{X}^p (||u||_{X}^p + ||u||_{X}^{p-2}).
\]
Now, plugging the above two estimates into eq. (4.1) and since $u_k \rightarrow u$ in $X$ we get
\[
||Tu_k, g|| - \langle Tu, g \rangle \leq C||g||_X (1 + \lambda_{s,p}(\Omega))||u_k - u||_X(||u||_{X}^p + ||u||_{X}^{p-2}) \frac{k}{p} \rightarrow 0.
\]
This proves that $T$ is demicontinuous.

**3) Coercivity:** Let $\{u_k\}$ be a sequence of functions in $X$ such that $||u_k||_X \rightarrow \infty$, as $k \rightarrow \infty$. Then, by fractional $p$-Hardy’s inequality eq. (1.9) we obtain
\[
\langle Tu_k, u_k \rangle = \int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \frac{|u(x) - u(y)|^p}{|x - y|^{n+sp}} \, dx \, dy - \lambda_{s,p}(\Omega) \int_{\mathbb{R}^n} \frac{|u(x)|^p}{\delta(x)^{sp}} \, dx
\]
\[
\geq (1 - C_H \lambda_{s,p}(\Omega)) \int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \frac{|u(x) - u(y)|^p}{|x - y|^{n+sp}} \, dx \, dy \geq \frac{1 - C_H \lambda_{s,p}(\Omega)}{1 + C_H} ||u_k||_X^p,
\]
and consequently this yields that
\[
\frac{\langle Tu_k, u_k \rangle}{||u_k||_X} \geq \frac{1 - C_H \lambda_{s,p}(\Omega)}{1 + C_H} ||u_k||_X^{p-1} \frac{k}{p} \rightarrow \infty,
\]
where $C_H$ is a constant.
Hence, $T$ is coercive. Therefore, the operator $T$ satisfied all the requirements of theorem 2.3. This implies that for a $g \in X^*$ with $g \geq 0$, $g \not\equiv 0$, there exists a solution $u \in X = W^{s,p}_\Omega(\mathbb{R}^n)$ of the equation $Tu = g$. In other words, $u$ is a fractional weak $p$-supersolution of eq. (1.7). Furthermore, the function $u$ is positive in $\Omega$. Indeed, as $u \in X$ then $u$ is also in $X$ (see, [32, Lemma 2.6]), where $u := \max\{0, -u\}$ is the negative part of the function $u$. Note that again by using fractional $p$-Hardy’s inequality eq. (1.9) we obtain

$$0 \leq \langle Tu, u_- \rangle = \int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \frac{|u(x) - u(y)|^{p-2}(u(x) - u(y))(u_-(x) - u_-(y))}{|x-y|^{n+sp}} dxdy$$

$$- \lambda_{s,p}(\Omega) \int_{\Omega} \frac{|u(x)|^{p-2}u(x)u_-(x)}{\delta(x)^sp} dx$$

$$= - \int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \frac{|u_-(x) - u_-(y)|^p}{|x-y|^{n+sp}} dxdy + \lambda_{s,p}(\Omega) \int_{\Omega} \frac{|u_-(x)|^p}{\delta(x)^sp} dx$$

$$\leq \left( \lambda_{s,p}(\Omega) - \frac{1}{C_H} \right) \int_{\Omega} \frac{|u_-(x)|^p}{\delta(x)^sp} dx \leq 0,$$

and consequently this implies that $u_-(x) = 0$ a.e. in $\Omega$. Hence $u$ is non negative and the positiveness of $u$ follows from the minimum principle (see, [7, Theorem A.1]). This completes the proof of the theorem.
